QUESTION PRESENTED FOR REVIEW

Whether state common law preempts federal regulatory law and the specific guidance of a federal agency defining the petitioners' property rights in their own body tissue used for medical research?

LIST OF PARTIES

Pursuant to Rule 14.1(b), the following list identifies all of the parties before the United States Court of Appeals for the Eighth Circuit.

Richard N. Ward, Thomas A. McGurk, Jr., Luis Garcia, Antonio Castro, Philip Wilard, Ivan Parron, James D. Ellis, Mike Missios, and William J. Catalona were the appellants below.

Washington University was the appellee below.

PETITION FOR A WRIT OF CERTIORARI

Petitioners Richard Ward, *et al.*, respectfully request this Court to issue a writ of certiorari to review a decision of the United States Court of Appeals for the Eighth Circuit.

OPINIONS BELOW

The decision of the United States Court of Appeals for the Eighth Circuit, reported at 490 F.3d 667 (8th Cir. 2007), is reprinted at Pet. App. 1a. The decision of the United States District Court for the Eastern District of Missouri, reported at 417 F. Supp.2d 985 (E.D. Mo. 2006), is reprinted at Pet. App. 21a.

JURISDICTION

The Court of Appeals' judgment was entered on June 20, 2007. This Court, per Justice Alito, granted a 30-day extension for filing a petition for certiorari on September 18, 2007. Petitioners invoke the jurisdiction of this Court pursuant to 28 U.S.C. § 1254(1).

FEDERAL REGULATORY PROVISION INVOLVED

This case involves 45 C.F.R. Part 46, known as the "Common Rule."

INTRODUCTION

This case presents questions as fundamental and important as those the Court has faced in the areas of reproductive choice and euthanasia. Dr. William Catalona, the preeminent prostate surgeon and researcher at Washington University ("the University"), oversaw research that asked thousands of men to provide tissue samples from cancerous prostate glands, while also collecting blood samples from those patients, their families, and others. These research participants (sometimes referred to hereafter as "RPs") generally lacked any independent knowledge about the risks and benefits of providing samples of their biological matter, making the decision to allow the use of their samples only after consultation with University personnel about their rights. The participants' rights were memorialized in consent forms drafted by the University. The forms varied over time but consistently provided that the research participants could end their participation at any point, bar further use of their samples, and even insist that the samples be destroyed. None of the consent forms ever stated that the University would become the owner of the RPs' tissue or blood.

When Dr. Catalona – a man whom many of the RPs credited with saving their lives – left for Northwestern University, petitioners and more than 6,000 other research participants directed Washington University to transfer the samples to Northwestern. Washington University refused and brought this action, arguing under state common law that it retained sole title to the samples.

In response, the research participants pointed to governing federal law. The U.S. Department of Health and Human Services regulates federally funded medical research, and has established the "Common Rule" to protect patient rights and ensure informed consent. That set of regulations provides that "[n]o informed consent, whether oral or written, may include any exculpatory language through which the subject . . . is made to waive or appear to waive any of the subject's legal rights." 45 C.F.R. § 46.116. The agency's Office for Human Research Protections ("OHRP") has interpreted the rule by giving examples of consent form language that the regulations prohibit. This is one example of a prohibited provision: "By consenting to participate in this research, I give up any property rights I may have in bodily fluids or tissue samples obtained in the course of research."

The federal district court discounted the agency's guidance entirely, concluding that the Common Rule did nothing more than prohibit the research institution from requiring the research participant to waive the right to file a tort action for malpractice or other negligence. The U.S. Court of Appeals for the Eighth Circuit affirmed, ruling under state law that the University had acquired ownership of the samples – and doing so without devoting a word of its opinion to the federal regulations or the agency's guidance. In so ruling, the courts disregarded the fact that federal regulations governing this research, and much of the rest of the medical research in this country, *prohibit* such a transfer of ownership.

This Court should grant review because the Eighth Circuit has established a precedent with breathtaking consequences for the petitioners and the many others who have provided (or might provide) tissue and blood samples for medical research. The question of the effect of the federal regulations in this important and sensitive context should be settled by this Court.

STATEMENT OF THE CASE

Dr. Catalona worked at Washington University from 1976 to 2003. During that time, he performed thousands of prostate surgeries. He also was instrumental in the creation of an enormously valuable biorepository of prostate tissue samples, blood samples, and DNA samples stored for use in research. His research led to the development of the PSA (prostate-specific antigen) test used to detect prostate cancer.

By 2003, the biorepository contained 3,500 tissue samples obtained during prostate cancer surgeries, and tens of thousands of samples of blood and other bodily fluids. To facilitate studies of the genetic aspects of disease, all of the samples were linked to identifying information about the individuals who provided them.

The research participants allowed the use of their tissue only conditionally. Dr. Catalona and the University presented the research participants with consent forms and, in most cases, an informational brochure that explained and governed their rights. The consent forms referred to the provision of samples as a "donation," but they also made clear

that a research participant could discontinue participation or withdraw consent at any time. Pet. App. 5a-6a. The accompanying brochure, which the research participants also signed, stated explicitly that a research participant could change his mind and ask that his samples no lo ger be used in research or even be destroyed. Pet. App. 6a. And these various documents also described the risks to the patients and their families of participating in genetics research, including the risk of discrimination in insurance and employment if the results were disseminated outside the confines of the study.

Dr. Catalona moved to Northwestern Medical School in 2003 and, at his request, about 6,000 people filed authorizations addressed to the University directing it to transfer their samples to Dr. Catalona at Northwestern. These requests led the University to file suit against Dr. Catalona seeking a declaratory judgment that it was the rightful owner of all materials in the biorepository. Dr. Catalona counterclaimed seeking a judgment that the tissue samples had been entrusted by the research participants to him and that he therefore had the right to possess them and continue the research that the RPs had authorized him to undertake. He also argued that the University's ownership claim violated the governing federal regulations.

Petitioners are eight research participants whom the district court added as additional defendants in the litigation between Dr. Catalona and the University. They were treated in the courts below as

representatives of the interests of the thousands of research participants who had asked to have their samples transferred to Dr. Catalona.[1] They argued that they retain all ownership rights in the samples under state law, by virtue of the language of the consent forms, and that they therefore have the right to direct that samples be transferred to Northwestern. They also consistently argued that the consent forms could not, as the University claimed, be read as conferring ownership on the University because federal regulations bar the University from even asking for such a surrender of the research participants' ownership of materials from their own bodies.

The regulatory requirements applicable to federally funded research like that conducted at the University are set forth in 45 C.F.R. Part 46, known as the "Common Rule." Among other things, the Common Rule requires that federally funded researchers obtain informed consent from anyone who becomes involved in medical research. 45 C.F.R. § 46.116. The elements that must be included in the informed consent request include a "statement that participation is voluntary, refusal to participate will involve no penalty or loss of benefits to which the subject is otherwise entitled, and the subject may discontinue participation at any time without penalty or loss of benefits to which the subject is otherwise entitled." *Id.* § 46.116(a)(8).

---

[1] Petitioners initially sought to intervene in the case. The district court denied that motion but then added petitioners as defendants, holding that they were "necessary parties" under Federal Rule of Civil Procedure 19.

Most significantly, the federal regulations do not permit forms used to obtain informed consent to "include any exculpatory language through which the subject . . . *is made to waive or appear to waive any of the subject's legal rights*, or releases or appears to release the investigator, the sponsor, the institution or its agents from liability for negligence." *Id.* § 46.116 (emphasis added). The italicized portion of the regulation has been authoritatively interpreted by the Office of Human Research Protections ("OHRP"). That document lists examples of "exculpatory" language barred by 45 C.F.R. § 46.116. This is one example of the *prohibited* language:

> By consent to participate in this research, I give up any property rights I may have in bodily fluids or tissue samples obtained in the course of the research.

See Office for Protection of Research Risks [now known as Office for Human Research Protections], "Exculpatory Language" in Informed Consent, *available at* http://www.hhs.gov/ohrp/humansubjects/guidance/exculp.htm (last visited Oct. 16, 2007).

After an evidentiary hearing, the district court held that the University owned and controlled the samples under Missouri law. Pet. App. 60a-62a. The court found that the research participants intended to make an *inter vivos* gift at the time they transferred samples to the biorepository. Pet. App. 45a-47a. It also concluded that the research participants' right to discontinue participation was

not inconsistent with the finding of a transfer of ownership, because that right meant only that a research participant could choose "not to provide any more biological materials." Pet. App. 52a.

With regard to the federal regulation barring use of "exculpatory language" waiving a subject's legal rights, the district court held that this rule only barred language by which a research participant would waive the right to bring a tort action – and thus did not bar language by which the research participant transferred ownership of samples. Pet. App. 49a. In so ruling, the court rejected entirely the notion that it had some duty, in interpreting a federal regulation, to defer to the interpretation offered in a document published by those who wrote the regulation. The court held that the OHRP document is non-binding because it is not itself contained in a regulation. Pet. App. 48a (the document "merely presents an opinion by the [OHRP] regarding exculpatory language in informed consent forms and provides examples. The examples are not found in any of the federal regulations governing the GU Biorepository."). And the court further held that its reading of the regulation should govern this case, despite the direct conflict with the interpretation provided by the administering agency. Pet. App. 48a.

Both Dr. Catalona and the research participants appealed. They argued, *inter alia*, that the district court had misunderstood the promises made to research participants about their right to discontinue participation in the research at any time. Because these promises clearly included the right to stop use

of samples previously provided and even to demand that those samples be destroyed, Dr. Catalona and the research participants argued that no gift of property rights had occurred as a matter of Missouri law.

In making this argument, the research participants also relied on federal law. They argued that any interpretation of the consent forms as effecting a transfer of ownership rights was barred by the federal regulations. *E.g.*, RP Br. at 29-33 (8th Cir. filed July 12, 2006); *see* RP Reply Br. at 20 (8th Cir. filed Sept. 21, 2006) ("[T]he Common Rule's prohibition on exculpatory language, 45 C.F.R. § 46.116, bars waiver of the RPs' ownership rights in the samples provided for research.").[2] They also argued at some length that the district court's rejection of a duty to defer to the administrative interpretation was erroneous. *See, e.g.*, RP Br. at 31-33 (citing *Glover v. Standard Federal Bank*, 283 F.3d 953, 962 (8th Cir. 2002)).

---

[2] In its brief opposing a stay, the University claimed that petitioners did not really rely on federal law in making their arguments in the lower courts. That is incorrect. While it is true that they discussed state property law in the course of claiming that ownership never transferred, they also said that any contrary ruling was barred by federal law. And while they did state that the "Common Rule . . . provides an interpretative guide in this case, rather than an independent basis for the RPs' rights," RP Reply Br. at 12 n.6, that was merely to explain that there is no "private right of action" issue here. The research participants are claiming rights under state property law, and the University's interpretation of the consent forms is preempted by federal law.

The Eighth Circuit nevertheless affirmed, holding that the ownership of the samples, under Missouri law, had transferred to the University, subject only to the retained right of the research participants to direct that their samples no longer be used or be destroyed. Pet. App. 16a-18a. On that basis, the court of appeals held that the research participants had no right to ask that their samples be transferred for use by Dr. Catalona at Northwestern. Pet. App. 18a-19a.

Remarkably, the court of appeals never even referred, in its published opinion, to the Common Rule and the argument that federal law precluded treating the consent forms as a transfer of ownership rights. It never explained how an unconditional right to control use of the tissue and to exclude others by requiring the tissue's destruction (rights protected by the federal regulations) could be reconciled with the finding that ownership of the property had been transferred completely. The court simply ignored that issue without explanation.

REASONS FOR GRANTING THE WRIT

The decision of the Eighth Circuit, if left unreviewed, will have a profound impact on medical research in this country and the relationship between researchers and those whom they ask to provide samples of tissue and blood. The federal government has erected a set of protections for research participants carefully designed to preclude just the kind of implicit transfer of title and control that the court of appeals found permissible here. The Eighth Circuit's unprecedented refusal to

recognize and enforce those limitations will be cited across the country as a justification for assertions of ownership over tissue and blood samples, which contain extraordinarily sensitive personal information, and which in this day and age have both tremendous commercial value and tremendous potential for harm to research participants. That should not be allowed to occur.

The federal regulators have left no doubt that language purporting to transfer ownership of the tissues themselves may not be included in informed consent forms for patients donating bodily tissues. A natural reading of the text of the regulation leads to that conclusion, and any potential doubt is eliminated by the agency guidance document expressly barring transfers of ownership. The district court's refusal to accord deference to that interpretation was flatly improper.

Even more improper and inexplicable was the Eighth Circuit's willingness to rule that the University had become the owner of all the samples in the biorepository without even addressing the question of whether federal law permits that result. The appellants in that court devoted a significant portion of their briefs to discussing the issue, and there was no reason for excluding the federal question from consideration. Nor should the court of appeals' ruling evade review simply because it reflects errors of omission rather than commission.

That is particularly true where, as here, the explicit and implicit rulings of the court of appeals are very likely to have a broad national impact. This

dispute has been closely watched across the country as a test case establishing the rights of research participants and research institutions with regard to "donated" tissue samples. As collections of tissue samples have come to take on not just scientific value but also commercial value, the risk of abuse has become heightened. Moreover, as biological research becomes increasingly sophisticated, the risk that the samples will be used for morally sensitive endeavors not approved by research participants, or used to reveal private information about those participants, increases as well. Indeed, the Eighth Circuit's decision that the University owns the samples, subject only to the research participants' right to withdraw them from research or have them destroyed, invites such abuse. There is now nothing to prevent the University from selling the samples to the highest bidder, regardless of the particular use that bidder intends.

At a minimum, the Court should ask for the views of the Solicitor General and/or vacate and remand summarily for a ruling on the federal issue. To allow the ruling below to stand without further review would, we respectfully submit, be unjustifiable.

I. The Ruling Of The Eighth Circuit That The University Owns Tissue And Blood Samples Provided For Use In Research Will Have A Broad Impact Nationwide.

This is a landmark case. Although nominally based on Missouri law, the Eighth Circuit's decision will be viewed as establishing the ability of medical researchers receiving federal funds to take full

ownership and control of tissue samples, subject at best to the research participants' limited rights to say that the tissue should no longer be used or should be destroyed. The case thus affects not only the 6,000 research participants who allowed the use of their tissue samples here, but also every research participant who has ever provided a sample for research and every person who may do so in the future.

That is true in part because it is evident that petitioners expressly relied on the Common Rule to prevent a finding of transferred ownership, but the courts nevertheless held that such a transfer occurred and was not barred by applicable federal regulations. Moreover, those holdings – explicit in the district court and implicit in the court of appeals – have been closely watched by universities, biotechnology companies, and researchers all over this country.[3]

---

[3] The extensive coverage of this case in scientific journals, national newspapers, and a variety of other publications documents the attention these decisions have received. *See, e.g.*, Jocelyn Kaiser, *Issues with Tissues*, 316 Science 1829 (2007); Jocelyn Kaiser, *Biomedical Research: Court Decides Tissue Samples Belong to University, Not Patients*, 312 Science 346 (2006); Rina Hakimian & David Korn, *Ownership and Use of Tissue Specimens in Research*, 293 J. Am. Med. Assn. 1325-26 (2005); R. Alta Charo, *Body of Research: Ownership and Use of Human Tissue*, 355 New Eng. J. Med. 1517 (2006); Michael A. Goldman, *Calamity Gene*, 445 Nature 819-820 (2007); Lori Andrews, *Who Owns Your Body? A Patient's Perspective on* Washington University v. Catalona, 34 J.L. Med. & Ethics 398 (2006); Cheryl Wittenauer, *Court: University Owns Research Samples*, USA Today, June 22, 2007; Michael Crichton,

What that means is that, for all practical purposes, the rule effectively enunciated in this case will be the rule that applies nationwide. And research participants will be left in the same unfortunate situation facing petitioners: they may have the right to direct that researchers stop using their tissues and destroy them, but until they do so, the research institution that now owns the samples may do whatever it pleases with them regardless of what it has previously told participants about its purposes. For example, the institution can sell them to a for-profit entity, which might in turn choose to release genetic information publicly. Or the institution can transfer them for use in a research protocol far afield from the study the research participants thought they were supporting. *See generally* U.S. Gen. Accounting Office, GAO 01-775T, *Human Subjects Research: HHS Takes Steps To Strengthen Precautions, But Concerns Remain* 2 (May 2001). These risks are very real, as demonstrated by the fact that the University here has emphasized the monetary value of the biorepository. 8th Cir. App. 2:512-13. This is one of the reasons that federal regulations prohibit a federally funded research institution from seeking or obtaining fee simple ownership over the cells excised from an identifiable person's body.

Opinion, *Body Snatchers, 2006*, Wall St. J., Dec. 15, 2006; Rebecca Skloot, *Taking the Least of You*, New York Times Mag., Apr. 16, 2006; *DNA Files: Who Owns Our DNA?* (Chicago Public Radio broadcast, Oct. 10, 2007), *available at* http://www.chicagopublicradio.org/Cityroom_Story.aspx?storyID=13902.

The University has argued that other federal regulations would bar such abuses. But it simultaneously took the position that, if it removed from its records the name and demographic details of the person who was the source of the tissue, those protections would evaporate. Br. of Appellee Washington Univ. at 30-31 (8th Cir. filed Aug. 26, 2006). At that point, the University, now the owner of the tissues, could do whatever it chose.

Thus, the only way a research participant can protect himself against abuse of his tissue samples is to ask that they be destroyed. But that presents an intractable dilemma. The only way to prevent misuse of the sample, of which research participants will have no advance warning, is to prevent use of the sample for its intended purpose – aiding research on prostate cancer – by demanding its immediate destruction. That is the outcome that the Eighth Circuit's misguided ruling will lead to in many cases.

The effects of the ruling on potential research participants will be equally profound. Individuals will be far less likely to consent in the first place if they are asked to give up all ownership and control of their own tissues, without any way of knowing how their cells, blood, and DNA will be used or whether they will be sold. *See generally* Lori Andrews, *A Patient's Perspective on* Washington University v. Catalona, 34 J.L. Med. & Ethics 398 (2006). Perhaps the University believes such a regime will aid its research, but it is far more likely to discourage participation by those – like cancer survivors Richard Ward, Thomas McGurk, Luis Garcia, Antonio Castro, Philip Wiland, Ivan Parron,

James Ellis, and Michael Missios – whose trust in research institutions make research possible in the first place.

II. The Ruling Of The Eighth Circuit Collides With Binding Federal Regulations.

The Eighth Circuit's willingness to find a transfer of ownership here was erroneous. The administrative interpretation of the applicable federal regulation cannot be disregarded. Nor can state property law trump binding federal regulations.

This Court has made clear that under the Supremacy Clause of the Constitution, state law, including common law, is preempted when it conflicts with federal regulations or federal administrative determinations. *Geier v. American Honda Motor Co.*, 529 U.S. 861, 884-85 (2000); *see also Bates v. Dow Agrosciences LLC*, 544 U.S. 431, 453 (2005); *id.* at 454-55 (Breyer, J., concurring); *Medtronic, Inc. v. Lohr*, 518 U.S. 470, 504-05 (1996) (Breyer, J., concurring). Further, the Common Rule itself states that it preempts state law except to the extent that a state's law provides "additional protections," an exception that is not relevant in this case. 45 C.F.R. § 46.101(f).

Accordingly, in order to decide whether the University had become the owner of the samples in the biorepository, the courts below had to determine whether reading such a transfer of ownership into the consent forms would violate governing federal regulations. The district court seemed to accept this obligation, but then avoided the problem by refusing

to apply the relevant regulation or to defer to the interpretation of the regulation that had been adopted and published by the regulatory agency itself. The court of appeals simply ignored the issue. That was a clear legal error – the first an error of commission, the second an error of omission.

A. The Common Rule Prohibits Transfer Of Ownership.

Federal law contains a series of provisions that protect individuals who allow their biological matter to be used for research by federally funded institutions such as the University. The requirement of informed consent is a cornerstone of these protections. The first inviolable principle of human subject research is that participation must be voluntary. Thus, "no investigator may involve a human being as a subject in research covered by this policy unless the investigator has obtained the legally effective informed consent of the subject" (absent certain exceptions not relevant here). 45 C.F.R. § 46.116. The requirement of informed consent ensures that in dealing with sophisticated institutions individuals make knowing choices in matters that implicate their right to self-determination.

Federal law provides additional protections by making certain rights *unwaivable* even through informed consent. After stating that informed consent is required, the Common Rule provides that:

> No informed consent, whether oral or written, may include any exculpatory language through which the subject or

> the representative *is made to waive or appear to waive any of the subject's legal rights*, or releases or appears to release the investigator, the sponsor, the institution or its agents from liability for negligence.

45 C.F.R. § 46.116 (emphasis added).

The district court interpreted the regulation as barring only "exculpatory language involving releases from malpractice or other negligence." Pet. App. 49a. But that interpretation has little to recommend it. The regulation bars "exculpatory language through which the subject . . . is made to waive . . . any of the subject's legal rights, *or* releases . . . the investigator, the sponsor, the institution or its agents from liability for negligence." 45 C.F.R. § 46.116 (emphasis added). The district court read the regulation as if it included only the second clause and not the first. A reasonable interpretation must give independent meaning to both clauses.

The University also argued to the Eighth Circuit that the Common Rule tolerates transfers of ownership so long as the tissue is "de-identified." That is a flawed argument. The University's primary support for its de-identification theory is a citation to 45 C.F.R. § 46.102(f), which provides that research involves a "[h]uman subject" – and thus requires informed consent – only when the researcher "obtains [d]ata through intervention or interaction with the individual" or "[i]dentifiable private information." But the researchers here indisputably "obtain[ed] . . . identifiable private

information." The University is thus forced to argue that although it obtained the materials subject to the Common Rule's limitations, it has the unilateral right to de-identify the tissues and claim full ownership over them free of federal strictures. Yet nothing in the Common Rule even suggests that such a loophole exists – and this is not surprising given the gross intrusions on human dignity it would allow. In any case, even if the Common Rule did allow backdoor de-identification, that would not give the University ownership here: the tissues in question can never be fully de-identified because they contain the DNA of the research participants, which will always be traceable to them.

Finally, the University takes the position that the Common Rule cannot possibly mean what it plainly says, because forbidding unconditional donations of research tissue would be an undesirable policy result from the University's perspective. But the policy choices here have already been made through the Common Rule itself. Federal law does not prohibit all types of tissue transfers; for example, it is possible to completely transfer ownership of a kidney under organ donation laws. But where research is federally funded, research participants cannot give identifiable tissue unconditionally, allow it to be used for any purpose the researcher chooses, and waive all their rights. That is highly sensible. The Common Rule is cognizant of the research institution's comparative sophistication. It preserves incentives for human subject participation in medical research. And it guards against the significant risk that – because the same tissue sample can be used multiple

times – a research institution will inappropriately use the tissue in a way that the research participant objects to, such as by selling it, using it for cosmetics research, using it for research that violates the person's religious beliefs, or posting results like identifiable genetic sequences on the Internet. The public interest, embodied in the Common Rule, thus favors the research participants, not the University.

The force of the regulation is inescapable – and its effect is to prevent *any* language in the consent forms, whether or not that language is expressly labeled "exculpatory," from having the effect of depriving the research participants of their pre-existing ownership rights in their bodily tissues. But the Eighth Circuit ignored this binding regulation in reading the consent forms to waive the research participants' ownership rights under Missouri law. Even if that ruling were correct under Missouri law (and it is not for the reasons that the research participants argued to the Eighth Circuit), it is absolutely precluded by the Common Rule applicable through the Supremacy Clause.[4]

---

[4] As noted in Dr. Catalona's petition for certiorari from the Eighth Circuit's decision (filed simultaneously with this petition), the decision below also conflicts with the decisions of other courts that have found that the Common Rule's protections preempt conflicting state law. *See Catalona v. Washington University*, Petition for Certiorari filed by Petitioner William J. Catalona (citing conflicting decisions).

B. The OHRP's Authoritative Guidance Requires Reversal Of The Eighth Circuit.

If there were any question about the meaning of the federal regulation in this case (and there is not), it would be laid to rest by the authoritative guidance the OHRP has provided regarding the regulation. A court interpreting a regulation is duty-bound to give substantial deference to an interpretation of the regulation later adopted by the agency that promulgated it. Indeed, "an agency's interpretation of its own regulations is 'controlling' unless 'plainly erroneous or inconsistent with'" the language of the regulation. *Long Island Care at Home, Ltd. v. Coke*, 127 S. Ct. 2339, 2349 (2007) (quoting *Auer v. Robbins*, 519 U.S. 452, 461 (1997)); *see also Geier*, 529 U.S. at 883 ("The agency is likely to have a thorough understanding of its own regulation and its objectives and is 'uniquely qualified' to comprehend the likely impact of state requirements.").

The Office for Human Research Protections, which is the enforcement arm of HHS, has given authoritative guidance regarding the meaning of § 46.116. That guidance details waivers that are impermissible under § 46.116. One such impermissible provision is a statement substantively identical to the interpretation that the Eighth Circuit gave to the consent documents here – a statement that "[b]y consenting to participate in this research, *I give up any property rights* I may have in bodily fluids or tissue samples obtained in the course of the research." *See* Office for Protection of Research Risks [now known as Office for Human Research Protections], "Exculpatory Language" in

Informed Consent, *available at* http://www.hhs.gov/ohrp/humansubjects/guidance/exculp.htm (last visited Oct. 16, 2007).[5]

The OHRP's "guidance" is not merely precatory. On January 25, 2006, the OHRP directed Louisiana State University Health Science Center Shreveport to remove this language from its informed consent agreements: "By your consent to participation in this research study, you give up your property rights that you may have in your bodily fluids, substances or tissues." Indeed, even the University's own expert conceded at the district court hearing that to the extent the research participants' consent forms purport to give up property rights, they are invalid under federal law. 8th Cir. App. 2:171.

The duty to accord deference is fully applicable to a guidance document like the one at issue here. Just last Term, this Court deferred to an interpretation of a regulation contained in an "advisory memorandum" that was issued "only to internal Department personnel and which the Department appears to have written in response to this litigation." *Long Island Care at Home*, 127 S. Ct. at 2349. The Court even said it would defer to a

---

[5] Notably, the Food and Drug Administration has interpreted the same regulatory language in the same way. The FDA has prohibited use of the term "donation" in consent forms because it impermissibly suggests that the research participant is giving up property rights in the tissue – a statement that the regulation forbids. *See* Guidance for Institutional Review Boards and Clinical Investigators (Question 52), *available at* http://www.fda.gov/oc/ohrt/irbs/faqs.html (last visited Oct. 16, 2007) (citing 21 C.F.R. § 50.20).

considered interpretation of a regulation contained in a legal brief filed by the agency. *Id.* The OHRP guidance document is much more entitled to deference than such informal expressions of an agency's viewpoint.

Despite extensive briefing on the subject, the Eighth Circuit simply ignored the OHRP's binding interpretation of controlling law when it held that under state law the University was the owner of the tissues – *i.e.*, that the research participants had through their "consent to participation . . . given up [their] property rights in the tissues." Pet. App. 29a. But the obligation to defer to a reasonable administrative interpretation does not evaporate just because a court fails to acknowledge it. The Eighth Circuit's holding thus conflicts with federal law and must be reversed.

C. The Research Participants Properly Invoked The Federal Regulations As A Constraint On State Property Law In This Context.

The University takes the position that the Common Rule on which petitioners rely is not relevant because there is no private right of action to enforce that regulation. That argument is a red herring. Petitioners did not initiate an action seeking to enforce the regulation directly, such as through injunctive relief or damages. Rather, this lawsuit was initiated by the University itself, which sought to enforce its claimed state-law property rights in the disputed tissue and blood samples. In such a context, it is not only proper but

determinative for the research participants and Dr. Catalona to argue that the University's state-law ownership claims were preempted by an applicable federal regulation, regardless of whether that regulation could have been enforced via a private right of action.

The reason is quite simple. Even if a federal regulation is not directly enforceable through an implied or express federal right of action, it still can be raised as a defense to a state-law cause of action to the extent that the regulation preempts such a cause of action. Thus, for example, in *Geier v. American Honda Motor Co.*, as well as *Medtronic, Inc. v. Lohr*, the federal preemption defenses were raised by the defendants in a state-law tort suit. There is no reason to treat this case any differently.[6] The University sued claiming to be the owner of material previously excised from petitioners' bodies. Petitioners had every right to argue that interpreting the consent forms as effecting a transfer of ownership was barred by the applicable federal law.

Petitioners also had every right to expect that the Eighth Circuit would address this question rather than ignore it. This Court should act to assure that

---

[6] Even if the research participants had brought an action directly under the Common Rule, seeking to enforce that Rule against the University's claims of property ownership, there still would not have been a private right of action issue. The Supremacy Clause provides a right of action to enforce federal law as against conflicting state law. *See Planned Parenthood of Houston v. Sanchez*, 403 F.3d 324, 331-35 (5th Cir. 2005) (analyzing *Pharmaceutical Research & Manufs. of America v. Walsh*, 538 U.S. 644 (2003)).

important rights are not lost, nationwide, as a result of the unfortunate inaction of the court of appeals.

CONCLUSION

For the foregoing reasons, the petition for certiorari should be granted. In the alternative, the Court should vacate and remand summarily for a ruling on the federal issue.

Appeals from the United States District Court for the Eastern District of Missouri

---

Submitted: December 13, 2006 Filed: June 20, 2007

Before WOLLMAN, RILEY, and SHEPHERD, Circuit Judges.

RILEY, Circuit Judge.

We are asked to determine the ownership of biological materials contributed by individuals for the purpose of genetic cancer research and currently housed on the campus of Washington University (WU). WU brought a declaratory judgment action against Dr. William Catalona (Dr. Catalona), a former WU medical school faculty member, seeking to establish WU's ownership of the research biological materials. Dr. Catalona counterclaimed, seeking a declaration the contributing individuals could direct the transfer of their biological materials

to him. Dr. Catalona also moved for an order prohibiting WU from utilizing, disseminating, transferring, or destroying the biological materials at issue. The district court[1] concluded WU owns the biological materials and neither Dr. Catalona nor any contributing individual has any ownership or proprietary interest in the disputed biological materials. These appeals followed. We affirm.

I. BACKGROUND

WU, a prominent private research university located in St. Louis, Missouri, houses its own medical school, including a Division of Urologic Surgery (Division). Within the Division, WU physicians treat patients, teach students and residents, and conduct medical research on urologic diseases such as prostate cancer. Dr. Catalona, a highly respected urologist and urologic surgeon and researcher, was employed by WU from 1976 to 2003, and he served as Division Chief from 1984 to 1998. During Dr. Catalona"s tenure at WU, he performed thousands of surgeries, many involving prostate cancer. As a leading medical researcher for WU, one of Dr. Catalona's principal areas of research was the genetic basis of prostate cancer. In 1983, Dr. Catalona began collecting samples of biological materials, such as blood and tissue removed during surgery, to be used later for prostate cancer research. Dr. Catalona encouraged his colleagues to do the same.

---

[1] The Honorable Stephen N. Limbaugh, United States District Judge for the Eastern District of Missouri.

Dr. Catalona was instrumental in establishing the GU[2] Biorepository (Biorepository), the world's largest storage facility for biological samples collected by Dr. Catalona and other WU physicians for prostate cancer research. The Biorepository is housed in one or more buildings owned by WU. WU provides the majority of funding necessary to support the maintenance and operation of the Biorepository. Additional funding is provided by public and private grants payable to and administered by WU as the "grantee." While employed by WU, Dr. Catalona raised several million dollars in outside funding for the Biorepository. Other WU employees, including Dr. Catalona's successor as Division Chief, also have raised a substantial amount of funds.

During the relevant time period, Dr. Catalona and other Division physicians performed many genetic cancer research studies, with each study naming a particular WU physician as the "principal investigator," a term designating the person "in charge of conducting the research protocol." Regardless of the physician designated as principal investigator on a particular research study, the named principal investigator generally collaborated with several other individuals in the research studies.

In order to conduct these studies, individuals were invited to participate in genetic research. Individuals who chose to donate excised prostate tissue or a blood sample to medical research and to become a research participant (RP) were required to

---

[2] "GU" is an abbreviation for genito-urinary.

complete an informed consent form.[3] Although the language of the consent forms differs, depending upon the nature of the particular study or the study's principal investigator, generally all of the forms contain similar provisions, such as the WU Medical Center or WU School of Medicine logo, the principal investigator, the purpose of the research, and the nature of the RP's participation.

The consent forms often used the term "donation" to describe the biological sample's transfer from the RP to a WU physician or medical technician. The forms also noted biological samples "may be used for research with our collaborators at [WU], other institutions, or companies." The consent forms typically provided that by participating in the study, the RP "agree[s] to waive any claim [he] might have to the body tissues that [he] donate[s]" and also "waive[s] the right to any new material or process developed through research involving [his] tissues." RPs also were informed by the consent forms, "Your participation is voluntary and you may choose not to participate in this research study or withdraw your consent at any time." Some consent forms indicated RPs could request destruction of their biological materials if they changed their minds about participating in the study, but noted it would not be possible to destroy or recall any research results already obtained. Other consent forms made no

---

[3] Fifteen versions of the consent forms, used for six different research studies, were admitted into evidence before the district court.

mention about an RP's right to request destruction of materials donated to research.[4]

In addition to the consent form, RPs received a genetic research information brochure (brochure) to review and sign. The brochure provided RPs' tissue samples (1) will be used by "[WU] Medical Center researchers," (2) "maybe shared with other authorized researchers doing research in similar fields at [WU] and other research centers," and (3) "may be used for studies currently in progress or studies conducted 10 or 20 years from now." Similar to the consent forms, the brochure used the term "donation" to describe the RP's participation, noting, "By agreeing to participate, you are making a free and generous gift of your tissue to research that may benefit society." The brochure advised RPs, "You will receive no monetary payment for your tissue nor can you claim ownership rights to any medical or scientific product that results from research with your tissue." The brochure also informed RPs of their right to have their biological materials destroyed upon request should they change their minds about participating in the research study.

At the time of the district court's permanent injunction hearing in this case, more than 30,000 RPs were enrolled in WU prostate cancer research studies. About 2,500 to 3,000 RPs had been patients of Dr. Catalona. The Biorepository contains: (1) approximately 3,500 prostate tissue samples taken from patients of Dr. Catalona and other WU

---

[4] Forms signed by seven of the eight defendant-patients fall within this category.

physicians within the Division; (2) about 100,000 blood or serum samples donated by over 28,000 men, 75% of whom were not patients of any WU physician, but rather were volunteers recruited through the media; and (3) DNA samples provided by approximately 4,400 men, which included patients of different WU physicians and relatives of those patients.

Over the years, other research institutions requested and received biological samples from the Biorepository to conduct genetic cancer research projects either in partnership with or independent of WU. While at WU, Dr. Catalona repeatedly transferred Biorepository materials to other research institutions pursuant to material transfer agreements (MTAs). The MTAs typically were signed by an authorized WU official as well as a providing investigator. Several MTAs personally signed by Dr. Catalona, as the principal or providing investigator, acknowledge WU as the owner of the biological samples.

In early 2003, Dr. Catalona accepted a faculty position at Northwestern University in Chicago, Illinois. Given his plan to continue genetic research in the area of prostate cancer, Dr. Catalona sent a letter in February 2003 to his patients, their relatives, and other individuals who had served as RPs informing them of his departure from WU and requesting transfer of biological materials. Attached to the letter was a "Medical Consent & Authorization" form (release form). In addition, both the letter and release form were printed in a newsletter from the Urological Research Foundation,

for which Dr. Catalona served as the medical director. Dr. Catalona estimated between 50,000 and 60,000 individuals received the letter and release form. Although Dr. Catalona was still a WU employee at the time he sent the letter and release form, Dr. Catalona was no longer the principal investigator on any of the research protocols involving biological samples he sought to have transferred to Northwestern University. Neither the letter nor the release form were approved by any WU administrators or WU's institutional review board. The letter discussed, among other things, Dr. Catalona's availability for treatment, his continuation of prostate cancer research, and his need for the tissue and blood samples "contributed to [him] over the years." In connection with Dr. Catalona's stated necessity, the letter requested the recipient sign and return to Dr. Catalona the attached release form, which set forth the following language:

> I have donated a tissue and/or blood sample for Dr. William J. Catalona's research studies. Please release all of my samples to Dr. Catalona at Northwestern University upon his request. I have entrusted these samples to Dr. Catalona to be used only at his direction and with his express consent for research projects.

Approximately 6,000 RPs returned completed release forms to Dr. Catalona.

A. Procedural Background

On August 4, 2003, WU filed a declaratory judgment action against Dr. Catalona, seeking to establish WU's ownership of the Biorepository and the biological materials contained therein. Dr. Catalona counterclaimed and sought a declaration that the RPs have the right to direct the transfer of their biological samples to him. In January 2004, WU moved for summary judgment. On June 8, 2004, after filing several extensions to respond to WU's summary judgment motion, Dr. Catalona moved for an order prohibiting WU from utilizing, disseminating, transferring, or destroying the genetic material at issue The following day—and before WU could respond—the district court temporarily granted the motion. WU then moved to set aside the district court's order, arguing Dr. Catalona was truly seeking a preliminary injunction. The district court agreed, withdrew its June 9, 2004, order, converted Dr. Catalona's motion to a motion for a preliminary injunction, and set the motion for hearing.

On February 11, 2005, in an effort to resolve continuing disputes between the parties on the priority of the pending motions, the district court, sua sponte, ordered a permanent injunction hearing for April 11, 2005. On February 22, 2005, eight of Dr.Catalona's patients who served as RPs,[5] sought to intervene in support of Dr. Catalona. Upon finding

---

[5] The men included Richard N. Ward; Thomas A. McGurk, Jr.; Luis Garcia; Antonio Castro; Phillip Wilard; Ivan Parron; James D. Ellis; and Michael Missios.

the eight men were necessary parties to the litigation, the district court ordered they be joined as defendants.

Following a three-day hearing on the permanent injunction, the district court found (1) WU was the owner of the biological samples housed in the Biorepository, (2) neither Dr. Catalona nor any RP in connection with any research protocols conducted under the auspices of WU had any ownership or proprietary interest in the biological samples in question, and (3) none of the release forms authored by Dr. Catalona and signed by any RP were effective to transfer ownership or possession of the biological samples to Dr. Catalona or to any other research facility or individual. *Wash. Univ. v. Catalona*, 437 F. Supp. 2d 985, 1002 (E.D. Mo. 2006). Therefore, the district court granted WU's motion for summary judgment and denied Dr. Catalona's motion to enjoin WU's use of the biological samples. This appeal followed.

II. DISCUSSION

A. Standards of Review

Because the district court's finding that WU owns the biological samples resolved all issues in the case, we have jurisdiction under 28 U.S.C. § 1291 to review the defendants' appeal from a final decision of the district court. We review de novo the district court's grant of summary judgment. *See Burlington N. & Santa Fe Ry. Co. v. State Tax Comm'n*, 188 F.3d 1039, 1041 (8th Cir. 1999). We may affirm a grant of summary judgment on any ground supported by the record. *See P & O Nedlloyd, Ltd. v. Sanderson*

Farms, Inc., 462 F.3d 1015, 1018 (8th Cir. 2006). We review the district court's denial of injunctive relief for an abuse of discretion. *See Int'l Ass'n of Machinists & Aerospace Workers, Dist. Lodge No. 19 v. Soo Line R. Co.*, 850 F.2d 368, 374 (8th Cir. 1988) (en banc). An abuse of discretion occurs if the district court bases its decision on an erroneous application of the law or a clearly erroneous factual finding. *See Taylor Corp. v. Four Seasons Greetings, LLC*, 403 F.3d 958, 967 (8th Cir. 2005).

B. Ownership of the Biological Materials

We now turn our attention to the pivotal inquiry in this dispute: whether individuals who make an informed decision to contribute their biological materials voluntarily to a particular research institution for the purpose of medical research retain an ownership interest allowing the individuals to direct or authorize the transfer of such materials to a third party. Under the facts of this case, the answer is no.

In deeming WU the owner of the biological samples, the district court found all RPs donated their biological materials to WU as inter vivos gifts.[6] *Wash. Univ.*, 437 F. Supp. 2d at 999. In addressing this issue, we look to the substantive law of Missouri, which defines an inter vivos gift as "a voluntary transfer of property by the owner to another, without

---

[6] Whether the RPs made inter vivos gifts is a state law question of fact. *See Estate of Thompson v. Hicks*, 148 S.W.3d 32, 36 (Mo. Ct. Ap. 2004). We review de novo the district court's interpretation of state law. *See Protective Life Ins. Co. v. Jim Orr & Assoc., Inc.*, 384 F.3d 949, 950 (8th Cir. 2004).

any consideration or compensation as an incentive or motive for the transaction." *Pilkington v. Wheat*, 51 S.W.2d 42, 44 (Mo. 1932); *see, e.g., Wills v. Whitlock*, 139 S.W.3d 643, 653 (Mo. Ct. App. 2004). As the party claiming the existence of an inter vivos gift, WU bears the burden to prove by clear and convincing evidence there was (1) present intent of the donor to make a gift, (2) delivery of the property by the donor to the donee, and (3) acceptance of the gift by the donee, whose ownership takes effect immediately and absolutely. *See Clippard v. Pfefferkorn*, 168 S.W.3d 616, 618 (Mo. Ct. App. 2005). The RPs unquestionably delivered their biological materials to WU at the time of their donation; thus, we focus our inquiry on the first and third elements.

With regard to the first element, we assess the donor's intent by examining whether a gift was intended at the time of the transaction. No specific language is required to reflect the donor's present intent to make a gift; in fact, the circumstances surrounding the contribution may create an inference the donor intended to make a valid inter vivos gift. *See Duvall v. Henke*, 749 S.W.2d 714, 716 (Mo. Ct. App. 1988). However, the donor must intend "to part with his right in and dominion over the property immediately and irrevocably." *Ridenour v. Duncan*, 246 S.W.2d 765, 769 (Mo. 1952). Here, the circumstances surrounding the RPs' decisions to participate in genetic cancer research demonstrate the status of the RPs as donors and their intent to make gifts of their biological materials to WU's medical research activities. Before

participating in WU' s research activities, each RP was required to read and sign the consent form, which bore WU's logo and characterized the RP's participation as a "donation" of bodily tissues or blood. The consent form emphasized the voluntariness of the RP's participation and discussed the RP's right to decline participation in the study or to withdraw consent at any time. Although some RPs were Dr. Catalona's patients, many other RPs were patients of different WU doctors and participated in research studies designating someone other than Dr. Catalona as the principal investigator. Even the consent forms designating Dr. Catalona as the study's principal investigator invited RPs "to participate in a research study conducted by Dr. William J. Catalona *and/or colleagues*." (emphasis added). The consent forms also advised RPs their biological samples "may be used for research with our collaborators at [WU], other institutions, or companies."

Our conclusion the RPs intended to make gifts of their biological samples at the time of their donation is bolstered further by the language of the brochure, which characterized the RPs' donations as "a free and generous gift of [biological materials] to research that may benefit society." The brochure's acknowledgment that donated materials may be shared with non-WU researchers, without any further authorization needed from the RPs, informed the RPs they would relinquish or abandon the right to designate the particular destination of their biological materials upon agreeing to participate in a medical research study. Such language, considered together with the consent form, cannot reasonably be

characterized as reflecting the RPs' intention either to entrust their samples solely to Dr. Catalona or to transfer the samples in some legal form other than a gift.

With regard to the third element—acceptance of the gift by the donee—the defendants contend the RPs retained significant rights in the donated materials, and thus the transfer of materials to WU could not have been absolute. We disagree. WU accepted and retained absolute possession of the biological materials immediately upon donation. Although Missouri law generally prohibits a donor from revoking a completed inter vivos gift once the gift is delivered to and accepted by the donee, an inter vivos gift nevertheless may be subject to a condition allowing the donor to exercise a particular revocation right in the future. *See Clippard*, 168 S.W.3d at 619; *see, e.g., Franklin v. Moss*, 101 S.W.2d 711, 714 (Mo. 1937). The attachment of a condition to a charitable donation of property does not negate or void an otherwise valid inter vivos gift. *See* 14 C.J.S. Charities § 34 (2006) (recognizing "the disposition of property for charitable purposes . . . can be in the form of an absolute transfer subject to conditions"). Indeed, as WU points out, a contrary rule would make many charitable donations wholly impossible or ineffectual. In this case, the signed consent forms and the brochure delineate the specific and limited recourse placed upon each RP's donation of biological materials should an RP change his mind about participating in the medical research: namely, the right to revoke voluntary participation in or consent to the research study, and, in some of the consent

forms, the right to request destruction of the donated biological materials.

Under the terms of the consent forms and brochures, the RP's participation in genetic cancer research includes answering questions about the RP's family history of cancer, having blood drawn, and allowing excised tissue and blood samples to be sent to a laboratory and used for research at WU or other institutions. Additionally, should an RP experience a change of heart about participating in genetic cancer research, the RP is entitled to request his biological materials no longer be used, and under the terms of the brochures (and some of the consent forms as well), the materials would be identified and destroyed upon request. Viewing these provisions in their entirety, it is evident the RPs did not retain the right to revoke and physically repossess the donated biological materials. Nor did the RPs retain the right to direct or authorize the use, transfer, or destination of the biological materials after their donation. The RPs' subsequent rights to their biological materials were expressly limited to the option to discontinue participation in the study to avoid answering additional questions, donating more biological materials, or allowing their biological materials to be used for further research. Beyond these particular and limited rights, the RPs retained no greater interest with regard to their biological materials. Such rights cannot be equated with or

interpreted to include the broad privileges or proprietary interests advocated by the defendants.[7]

Dr. Catalona's past conduct, as well as the practical consequences of the research process itself, also refutes the defendants' position. While at WU, Dr. Catalona signed numerous MTAs and research agreements acknowledging WU's ownership of the biological materials. Moreover, during Dr. Catalona's tenure, he routinely ordered the destruction or "purging" of Biorepository samples in order to create more storage space, and did so without obtaining any additional consent from RPs. Dr. Catalona's habitual destruction of samples, in a manner consistent with apparent indifference to any proprietary interest of the donors, is at odds with his later assertion the RPs own the biological materials.[8] Furthermore, during research involving the use of prostate tissue and blood samples, the research

---

[7] Because the specific language contained in the consent forms and brochures, as well as the circumstances surrounding the RPs' voluntary decision to donate their biological materials, convinces us the RPs intended to make inter vivos gifts of their materials, we find it unnecessary to address the effect or validity of the consent forms' waiver language ("By agreeing to participate in this study, you agree to waive any claim you might have to the body tissues that you donate.")

[8] Dr. Catalona's privileges to and treatment of biological samples while at WU comports with the terms of WU's Intellectual Property Policy, which provides "all intellectual property (including . . . tangible research property) shall be *owned by the University* if significant University resources were used or if it is created pursuant to a research project funded through corporate, federal or other external sponsors administered by the University." (emphasis added).

process might consume an entire particular biological specimen, leaving behind no tangible material in which a donor could assert a potential proprietary interest. It is difficult to reconcile the use, consumption, and destruction of biological materials by Dr. Catalona and the events that occurred during the research process with the assertion the RPs retained an ownership interest in the donated materials.

Noticeably absent from the record is any mention the RPs ever were informed they could physically withdraw or request the return of their biological samples. Indeed, in no event *could* the samples physically be returned to their donors. Federal and state regulations prohibit such a result by defining excised body tissue and blood as hazardous substances or infectious waste, and by articulating the proper disposal method. *See* 29 C.F.R. § 1910.1030; Mo. Rev. Stat. §§ 260.200.1(17), 260.203. Nor could RPs who were surgical patients reasonably have anticipated they had any right to have excised materials returned to them following surgery, because before undergoing surgical procedures, patients were required to sign standard surgical consent forms acknowledging that tissues removed during surgery and not used for clinical purposes would be destroyed as hazardous medical waste. Also absent from the record is any indication the RPs ever were informed they had the ability to direct the transfer of their samples to another entity for research purposes. Based on the record before us, we conclude WU's acceptance of the donated biological materials was absolute.

Thus, the district court properly concluded the RPs made informed and voluntary decisions to participate in genetic cancer research, and thereby donated their biological materials to WU as valid inter vivos gifts.[9] This voluntary transfer of tissue and blood samples to WU—without any consideration or compensation as an incentive for doing so—demonstrates WU owns the biological samples currently housed in the Biorepository. Whatever rights or interests the RPs retained following their donation of biological materials, the right to direct or authorize the transfer of their biological materials from WU to another entity was not one of them. Thus, the release forms authored by Dr. Catalona and signed by approximately 6,000 RPs are ineffective to transfer possession of biological samples housed in the Biorepository to another entity. Given WU' s ownership of the biological materials, the district court neither abused its discretion in denying Dr. Catalona's motion for injunctive relief, nor erred in granting summary judgment in WU's favor.

III. CONCLUSION

For the foregoing reasons, we affirm the well-reasoned opinion and judgment of the district court.

---

[9] Given our conclusion the RPs made inter vivos gifts to WU, it is unnecessary for us to address, in detail, whether the RPs are entitled to control the disposition of their biological materials under the law of implied bailments. However, in our view, the district court correctly rejected this argument as unavailing

Appendix B

UNITED STATES COURT OF APPEALS
FOR THE EIGHTH CIRCUIT

No: 06-2286

Washington University,
Appellee

Appeal from U.S. District Court for the Eastern District of Missouri - St. Louis
(4:03-cv-01065-SNL)
JUDGMENT

This appeal from the United States District Court was submitted on the record of the district court, briefs of the parties and was argued by counsel.

After consideration, it is hereby ordered and adjudged that the judgment of the district court in this cause is affirmed in accordance with the opinion of this Court.

June 20, 2007

Order Entered in Accordance with Opinion:
Clerk, U.S. Court of Appeals, Eighth Circuit.

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF MISSOURI
EASTERN DIVISION

THE WASHINGTON UNIVERSITY,
v.
WILLIAM J. CATALONA, et al.,

No. 4:03CV1065SNL

MEMORANDUM OPINION

Plaintiff Washington University (hereinafter referred to as "WU") has filed this declaratory judgment action seeking to establish "ownership", and thereby, the destiny of certain research biological materials currently stored in the GU Biorepository. Central to the several pending summary judgment motions, and preliminary injunction motion(s) is the issue of "ownership"; thus, the Court determined that the most logical and efficient manner in which to address this issue was to hold a permanent injunction hearing in which all interested parties, including research participants who "donated" the subject biological materials, could coherently present their argument to the Court. On April 9 through 11, 2005, such a hearing took place before this Court. At the conclusion of the hearing, all parties were permitted to file post-hearing briefs, and this matter is now ripe for disposition.

After careful consideration of all objections to exhibits and testimony taken with the case, all said objections are hereby overruled, and all exhibits

offered into evidence at the hearing are received into evidence. All testimony will be considered by the Court and given its due weight. This Court, having now considered the pleadings, the testimony of witnesses, documents in evidence, and any other evidentiary materials submitted for the Court's consideration, and being fully advised in the premises, hereby makes the following findings of fact and conclusions of law as required by Rule 52, Federal Rules of Civil Procedure.

FINDINGS OF FACT[1]

Plaintiff Washington University (WU) is a Missouri not-for-profit corporation with its principal place of business in St. Louis, Missouri. WU is one of the leading private research universities in this country, if not in the world. As a research university, it has a medical school (Washington University School of Medicine) that includes a Department of Surgery and a Division of Urologic Surgery. The medical faculty regularly pursues and publishes significant original medical research. Within the Division of Urologic Surgery, WU

---

[1] The Court's factual findings are derived from the transcripts of the permanent injunction hearing (Vols. 1-3); the parties' exhibits, deposition testimony, and the parties' briefs. Where necessary, the Court will cite to specific evidence and/or testimony. Where more than one copy of the same exhibit has been filed by different parties, the Court will cite to only one exhibit; however, the reference should not be considered any indication of bias on the part of the Court. Referring to only one of duplicative (in some cases, triplicative) exhibits is simply a matter of judicial efficiency.

physicians treat patients, teach students and residents, and conduct medical research.

Defendant William J. Catalona, M.D.[2] is a highly respected urologist and urologic surgeon, as well as a well-established medical researcher regarding prostate cancer. He was employed by WU from July 1, 1976 until February 23, 2003. Dr. Catalona was Chief of the Urology Division from 1984 to 1998. While at WU, Dr. Catalona performed thousands of surgeries, including prostate cancer surgeries. He was instrumental in establishing the GU[3] Biorepository for the collection and storage of biological research materials. In 2003, Dr. Catalona left his position with WU to take a similar position with Northwestern University in Chicago, Illinois and to continue his prostate cancer research.

The GU Biorepository houses biological specimens of prostate tissue, blood, and DNA samples for prostate cancer research. Patients of Dr. Catalona, as well as several other WU physicians, contributed biomaterials for prostate cancer research. As of the date of the hearing, there were more than 30,000 research participants enrolled in prostate cancer research studies; of these, 2500-3000 had been patients of Dr. Catalona. There are approximately 3500 prostate tissue samples in the GU Biorepository taken from patients of Dr. Catalona and other WU physicians within the Urologic Surgery Division. There are approximately

---

[2] Defendant Catalona is also a Counterclaim Plaintiff.

[3] genito-urinary

100,000 serum samples in the GU Biorepository; 75% of these contributions were made from research participants who were not patients of Dr. Catalona or any other WU physician. Approximately 4400 men contributed DNA samples to the GU Biorepository; again, some were patients of Dr. Catalona, while others were not. The GU Biorepository is not used for clinical care or follow-up care; it is strictly used for research purposes. At times, other research institutions have requested and received samples from the GU Biorepository for research projects outside of WU (or in partnership with WU). The transfer of such material is made pursuant to a Material Transfer Agreement (MTA). At least seven (7) of these MTAs personally signed by Dr. Catalona acknowledge WU as the owner of the biological samples at issue in this case. Plaintiff's Exhibits 7-10, 12-14.

At all relevant times, the GU Biorepository has been housed in one or more buildings owned by WU. At all relevant times, WU employees have administered the GU Biorepository. WU has provided the majority of funding necessary to operate and maintain the GU Biorepository. External funding for the GU Biorepository is in the form of public and private grants made to and administered by WU as the grantee. Dr. Catalona, as a WU employee and physician, has raised several million dollars in outside funding for the GU Biorepository. Other WU employees, most notably Dr. Gerald Andriole (Dr. Catalona's successor as Urology Division Chief), have raised substantial funds for the GU Biorepository.

WU's Intellectual Property Policy states that "all intellectual property (including . . . tangible research property) shall be owned by the University if significant University resources were used or if it is created pursuant to a research project funded through corporate, federal, or other external sponsors administered by the University." Plaintiffs Exhibit 17, §I.3(a). It further states "[G]enerally, creators and research investigators will retain custody of tangible research property while at the University." Plaintiffs Exhibit 17, §1.3(a).

Defendants Richard Ward, Thomas McGurk, Luis Garcia, Antonio Castro, Phillip Wilard, Ivan Parsons, James Ellis, and Michael Missins[4] are/were patients of Dr. Catalona and participants in one or more research projects at WU in which Dr. Catalona was involved.[5]

During the relevant time-period, several prostate cancer studies have been undertaken by Dr. Catalona and other doctors in the Urology Division. Dr. Catalona, as well as other WU physicians, were named "Principal Investigators" on these studies. Dr. Catalona testified that the principal investigator "is in charge of conducting [a] research protocol."

---

[4] Ward, McGurk, and Ellis testified at the hearing.

[5] In order for simplicity and judicial efficiency, the persons who contributed samples to the GU Biorepository are collectively referred to as "research participants" and include the eight (8) men who have been allowed to intervene in this case and refer to themselves as "patient/defendants."

Tr.I:46.[6] The testimony at the hearing established that regardless of who was listed as the "Principal Investigator", the research studies were a collaborative effort involving substantial work by many individuals, all of whom were/are employees of WU.

In order to carry out the subject prostate cancer research studies[7], surgical and non-surgical research participants (hereinafter referred to as "RPs") were invited to participate in genetic cancer research. If they agreed to participate, they had to sign "informed consent" forms. Although the informed consent forms differed slightly due to variances in the protocol and the particulars of each Principal Investigator, generally they all contained the similar language. The informed consent forms typically bore the WU Medical Center logo. Plaintiff's Exhibits 27, 58, 59, 60, 61, and 98; Catalona Exhibit UUU; RP Exhibit 1. The informed consent forms state that the collection of samples is for medical research and not for patient care. They typically stated that the RP could not "claim ownership rights" to any medical or scientific product that results from research with the sample. They typically use the word "donate" to characterize the delivery of the sample (blood, tissue

---

[6] When citing to hearing testimony, the Court will use the following notation: "Tr" stands for transcript; the number following TR stands for Vol. 1, 2. or 3; and the number after the colon is the page number. Thus, the referenced testimony can be found in Vol. 1 of the hearing transcript on page 46.

[7] Testimony and documents refer to the cancer research studies as "protocols", a term which the Court may use from time to time.

and/or DNA) from the RP to the WU physician or another WU medical technician. They typically state that by participating, the RP "make[s] a free and generous gift of your [blood, tissue and/or DNA] to research that may benefit others." Furthermore, the typical WU informed consent form states that "[y]our participation is voluntary and you may choose not to participate in this research study or withdraw your consent at any time." Some forms use the phrase "withdraw my consent and discontinue participation." None of the submitted WU informed consent forms address the issue of the RP withdrawing samples from the GU Biorepository or the RP requesting samples be sent to another institution.

Along with the informed consent forms, RPs are given a WU Genetic Research Brochure (to also sign) which generally addresses the issues of primary importance to the RP. Cataluna Exhibit X. Under the section: **What if you change your mind?,** the brochure states the following: "To request that your tissue no longer be used for research, you should call the investigator listed on the consent form. Your tissue will be identified and destroyed upon request. Any research results already obtained cannot be destroyed or recalled." Nowhere in the brochure does it state anything about a RP withdrawing his/her sample or a RP requesting that his/her sample be transferred to another facility.

WU is a federally approved and regulated institution for the human-subject research involving the GU Biorepository. The Department of Health and Human Services (MIS) office known as the Office

for Human Research Protection (OHRP) is responsible for the oversight of compliance by WTJ, and all other federally-funded institutions, engaging in human-subject research studies.[8] The OHRP requires that such institutions and facilities comply with the federal regulations set forth at 45 C.F.R. Part 46, a.k.a. "The Common Rule".[9] Among other things, the Common Rule requires every institution conducting and/or sponsoring human-subject research to create and maintain an institutional review board a.k.a. IRB. 45 C.P.R. 46.103. "An IRB shall review and have authority to approve, require modifications, in (to secure approval), or disapprove all research activities covered by this policy." 45 C.F.R. 46.109(a). "An IRB shall require that information given to subjects as part of informed consent is in accordance with Sec. 46.116." 45 C.F.R. 46.109(b). The IRB relevant to the GU Biorepository is known as the Human Studies Committee a.k.a. HSC.

The federal regulations also require WU to provide written assurance to the OHRP of its compliance with the Common Rule. 45 C.F.R. 46.103(a). Such "assurance" should include: "(1) a statement of principles governing the institution in the discharge of its responsibilities for protecting the rights and welfare of human subjects of research conducted at or sponsored by the institution, regardless of whether the research is subject to

---

[8] Prior to 1999, this office was known as the Office for Protection from Research Risks (OPRR).

[9] See Attachment A - 45 C.P.R. Part 46, Subpart A.

federal regulation. This may include an appropriate existing code, declaration, or statement of ethical principles, or a statement formulated by the institution itself % (2) the designation of one or more IRBs established in accordance with the requirements of this policy; (3) a list of IRB members; and (4) "[wjritten procedures which the IRB will follow (i) for conducting its initial and continuing review of research and for reporting its findings and actions to the investigator and the institution; (ii) for determining which projects require review more often than annually and which projects need verification from sources other than the investigator that no material changes have occurred since previous IRB review; and (iii) for ensuring prompt reporting to the IRB of proposed changes in a research activity and for ensuring that such changes in approved research, during the period for which IRB approval has already been given, may not be initiated without IRB review and approval *except* when necessary to eliminate apparent immediate hazards to the subject." 45 C.F.R. 46.103 (b)(1)-(4).

In compliance with the federal regulations, as stated before, WU has created and maintained an IRB known as the HSC. The HSC has created and maintained a written document entitled *Policies/Procedures for Protection of Human Research Subjects.* Catalona Exhibit O. The HSC has also created and maintained a written document entitled *Washington University School of Medicine - Human Studies Committee - Standard Operating Procedures.* Catalona Exhibit P. Finally, the DHHS

has approved the relevant Multiple Project Assurance submitted by WU. Catalona Exhibit I.

The Common Rule also sets forth certain requirements for informed consent. 45 C.F.R. 46.116. Foremost, the Common Rule requires that:

> "Except as provided elsewhere in this policy, no investigator may involve a human being as a subject in research covered by this policy unless the investigator has obtained the legally effective consent of the subject or the subject's legally authorized representative. An investigator shall seek such consent only under circumstances that provide the prospective subject or the representative sufficient opportunity to consider whether or not to participate and that minimize the possibility of coercion or undue influence. The information that is given to the subject or the representative shall be in language understandable to the subject or the representative. No informed consent, whether oral or written, may include any exculpatory language through which the subject or the representative is made to waive or appear to waive any of the subject's legal rights, or releases or appears to release the investigator, the sponsor, the institution or its agents from liability for negligence."

Among the basic elements to be included in an informed consent are:

> "(8) A statement that participation is voluntary, refusal to participate will involve

> no penalty or loss of benefits to which the subject is otherwise entitled, and the subject may discontinue participation at any time without penalty or loss of benefits to which the subject is otherwise entitled.

45 C.F.R. 46.116(a)(8).

Additional elements of informed consent, when appropriate, may include:

> "(4) The consequences of a subject's decision to withdraw from the research and procedures for orderly termination of participation by the subject; ..."

45 C.F.R. 46.116(b)(4).

The federal regulations do not elaborate as to what is involved when a RP "discontinue[s] participation" and/or "withdraw[s] from the research". The federal regulations do not address the matter of a RP's "right" to physically possess their samples upon termination of their participation in a research study; or, a "right" to direct their sample[s] transfer to another institution or Principal Investigator.

The OHRP publishes a guidance document addressing the issue of prohibited exculpatory language in informed consent forms. Catalano. Exhibit Q. This document was the result of a 1996 Cooperative Oncology Chairperson group meeting. The guidance document provides examples of "exculpatory language" that should not be considered for use in informed consent forms pursuant to 45 C.F.R. 46.116. One of the examples given states:

"By consent to participate in this research, I give up any property rights I may have in bodily fluids or tissue samples obtained in the course of the research." These examples are not listed anywhere or referred to anywhere in the relevant federal regulations.

Finally, 45 C.F.R. 46.117 requires that informed consent be documented as follows:

> "(a) Except as provided in paragraph (c) of this section, informed consent shall be documented by the use of a written consent form approved by the IRB and signed by the subject or the subject's legally authorized representative. A copy shall be given to the person signing the form."

(b) Except as provided in paragraph (c) of this section, the consent form may be either of the following:

> (1) A written consent document that embodies the elements of informed consent required by §46.116." (*remainder of paragraph omitted*).

As of the date(s) of the hearing, no regulatory agency, including the OHRP, has taken any action against WU regarding the informed consent forms used during the relevant time-period.

If a RP chooses to discontinue participation, federal and state regulations govern the options WU has regarding the tissue/blood/DNA sample. The undisputed testimony was that 1) WU may destroy samples it no longer needs for research; 2) store the

samples indefinitely; and/or 3) choose to "anonymize" the samples and continue to **use** them in certain areas of research.[10] Furthermore, if a prostate cancer surgical patient elects not to participate in research at the time of his prostate surgery, that portion of the diseased tissue not needed for clinical use must, in accordance with federal and state regulations, *be* treated as hazardous medical waste and prohibit returning the excised tissue to the patient. 29 C.F.R. §1910.1030 (bloodborne pathogens); §§260.200 R.S.Mo., 260.203 R.S.Mo. (infectious waste disposal); 10 C.S.R. §80-7.101 (infectious waste management).

In early 2003, Dr. Catalona left WU for Northwestern University in Chicago, Illinois. He intended to continue his research in the area of prostate cancer. In connection with **his** anticipated departure and continuation of his research at Northwestern University; on or about February **18,** 2003, *he* sent a letter to all research participants, whether or not they had been his patients, who had participated in his research protocols at WU. Catalona Exhibit HH. This letter informed these RPs of his departure from WU on or about February 24, 2003, of his continued availability for consultation and/or treatment, and his continuation for prostate cancer research. The letter was also included in a newsletter known as "*Quest*", published quarterly by the Urological Research Foundation, of

---

[10] To "anonymize" a sample, all links to the RP's personal identifying data is removed and the sample is no longer "linked" to a particular RP.

which Dr. Catalona was the Medical Director. Dr. Catalona testified that he believed that approximately 60,000 people received his February 18th letter either directly or via the Quest newsletter. Tr.2:32-33.

In apprising the recipients of the letter of his intention to continue his prostate cancer research, Dr. Catalona stated "[T]o succeed in these goals, I need to have the tissue and blood samples that patients, their relatives, and other research volunteers have contributed to me over the years. You have entrusted me with samples, and I have used them for collaborative research that will help in your future medical care and in the care of others for years to come." Attached to the February 18th letter was a "Medical Consent & Authorization" form stating:

> "I have donated a tissue and/or blood sample for Dr. William J. Catalona's research studies. Please release all of my samples to Dr. Catalona at Northwestern University upon his request. I have entrusted these samples to Dr. Catalona to be used only at his direction and with his express consent for research projects."

The letter asks the recipient of the letter to sign this "authorization for release" form and return it promptly to Dr. Catalona. Catalona Exhibit RH. Approximately 6000 recipients signed the form and returned it to Dr. Catalona. Tr.l :61; Tr.1:101; Cataluna Exhibit JJJJ.

At the time that Dr. Catalona sent the February 18, 2003 letter and release form, he was still an

employee of WU. Furthermore, he was no longer the Principal Investigator on any of the research protocols involving the samples he sought to have transferred to Northwestern University. He had transferred the role of Principal Investigator on his remaining active research protocols to another WU faculty member/researcher, Dr. Brian K. Suarez. Plaintiff's Exhibit 29. The letter and release form was sent by Dr. Catalona without prior approval of any WU administrators or the approval of the HSC. At the time he sent the letter and release form, Dr. Catalona did not have any approved research protocol at Northwestern University nor had he obtained the approval of the Northwestern University IRB prior to sending the letter and release form.

In 2002, WU formed a Peer Review Panel to consider requests from researchers, both within WU and outside of WU, to obtain and use biological samples from the GU Biorepository. Prior to leaving WU, Dr. Catalona had submitted three (3) such requests, and all three (3) have been approved and the requested biological materials provided to him for his research. As of the date of the hearing, Dr. Catalona had not made any additional requests for biological materials from the GU Biorepository to the Peer Review Panel for consideration.

CONCLUSIONS OF LAW

As stated previously, the sole issue determinative of this permanent injunction; in fact of this lawsuit; is the issue of ownership. That is, once having made voluntary donations of biological materials for

medical research to a research institution, do the research participants retain ownership rights in such materials in that they can direct said materials' use and transfer to third-parties. WU argues that the RPs made voluntary donations; *i.e.* gifts, of biological materials and once these "gifts" *were* delivered to WU, WU became the sole owner with control as to use and storage (pursuant to applicable federal and state regulations). Dr. Catalona and the RPs argue that the RPs had donated their biological materials with the "intent" that such materials stay with Dr. Catalona for his research.[11] The RPs believe that they have retained ownership rights in their donated biological materials and can withdraw said materials and have them transferred to Dr. Catalona and/or Northwestern University via their discontinuation of participation in any research at WU and their signing of Dr. Catalona's consent form.

Missouri law governs the substantive issues of ownership and "gift/donation". It is well-settled that exclusive possession and control of personal property is *prima facie* evidence of ownership, and anyone else claiming such property bears the burden of proof. *Foltz v. Pipes*, 800 S.W2d. 14, 15 (Mo.App. 1990); *State v. Patchen*, 652 S.W.2d. 265, 267 (Mo.App. 1983). The burden by the non-possessor asserting an ownership interest is met only by a preponderance of the evidence. *Foltz*, at 15; *Patchen*, at 267.

---

[11] It is undisputed by all the parties, and previously held by this Court, that Dr. Catalona has abandoned any legal argument as to his personal ownership of the subject biological materials.

It is undisputed that at all times WU has been in exclusive possession of the subject biological materials. WU has supplied all facilities housing the GU Biorepository. WU personnel has consistently maintained and administered the GU Biorepository. Although some funding of the GU Biorepository has been provided through Dr. Catalona's efforts, it was done so via his position at WU. The majority of funding for the GU Biorepository has been through the financial reserves of the Urology Division of the WU Medical School. It is undisputed that Dr. Catalona had access to the subject materials, but so did other researchers, both inside and outside of WU. Furthermore, such access was only through the IRB and HSC of WU. There was no evidence provided to this Court that any RP had access to his or her biological materials once such materials were made a part of the GU Biorepository.

WU had exclusive control over the subject biomaterials. As stated before, WU is solely responsible for deciding who can have access to the GU Repository and the use for such biomaterials. Even as Chief of the Urology Division, any decisions made by Dr. Catalona were made as a WU employee. WU alone bears all legal, regulatory, and compliance risks with respect to all research done in connection with the GU Biorepository. WU is a federally approved and regulated institution for the carrying out of human-subject research, for which the Biorepository was established. As such, it is continually responsible for ensuring that the GU Biorepository meets all necessary requirements; and does this through audits and substantial internal

compliance programs. Due to the nature of the GU Biorepository, WU is subject to federal and state laws and regulations governing the disposal and storage of human biological matter, and it alone is responsible for compliance with such laws and regulations. There was no evidence presented to this Court that any RP is equally responsible for the control of the use of these materials in human-subject research.

WU has continually asserted its ownership interests in the materials stored in the GU Biorepository. Its Intellectual Property Policy,[12] in existence prior to this dispute arising, states that tangible research property, including biological materials, belong to WU if significant university resources were used or such property was obtained pursuant to a research project funded by an external sponsor administered by WU. Furthermore, in all MIAs concerning these materials, including those wherein Dr. Catalona was the "Provider's Scientist", WU clearly exerted its ownership interest without objection by Dr. Catalona.[13] Even in the instance wherein Dr. Catalona attempted to change the language of a MTA to reflect "co-ownership" with WU, and WU refused to modify the language in the MTA, Dr. Catalona still signed.[14]

---

[12] Plaintiffs Exhibit 17.

[13] *Eg.* Plaintiff's Exhibit 14 - MTA dated June 1, 2001 between WU and the University of Cincinnati.

[14] Albeit Dr. Catalona testified that he felt he had no choice but to sign; yet still felt he had proprietary interest in the subject

There is little dispute as to the scarcity of legal precedent to assist the Court in addressing the situation that presently stands before the Court. The two (2) cases which provide the most guidance concluded that research participants retain no ownership of biological materials they contribute for medical research.[15] *Greenberg. et. al. v. Miami Children's Hospital Research Institute, Inc., et. al.*, 264 F.Supp. 1064 (S.D.Fla. 2003); *Moore v. The Regents of the University of California, et. al.*, 51 Cal.3d. 120, 793 P.2d. 479, 271 Cal.Rptr. 146 (CA. 1990).

In *Greenberg, supra.*, donors of human tissue and fluids (among others) sued the physician who received the biological materials, used them to isolate the gene causing Canavan disease, and then obtained patent and attempted to license the patent. The plaintiff donors claimed, among other things, that they had a property interest in their excised body tissue and in the genetic information extracted from such tissue; as well as the registry which contained the donors' personal and genetic information. They asserted that the defendant(s) had "converted" such information for the defendant(s)' own exclusive

---

biological materials, the Court finds that the document speaks for itself.

[15] Dr. Catalona and the patients/defendants have cited several other cases which the Court has reviewed and finds inapplicable. These cases involved sperm donation, possession of a dead body, and tax liability for donated blood, among other issues. None of the cases cited by Dr. Catalona and/or the patients/defendants involved the donation of biological materials for medical research.

economic benefit. *Id.* at 1074. The Court held that it "disagrees and declines to find a property interest for the body tissue and genetic information voluntarily given to Defendants. These were donations to research without any contemporaneous expectations of return of the body tissue and genetic samples, and thus conversion does not lie as a cause of action. *Id.* at 1074.

After recognizing that a claim of conversion was first predicated upon an ownership interest, the Florida district court, in adopting the reasoning of the *Moore* case, found that the plaintiff donors had no cognizable property interest in body tissue and genetic matter donated for medical research. *Greenberg*, at 1074. After reviewing Florida state court opinions regarding property rights and body tissue, as well as Florida statutes regarding genetic materials, the Florida district court found that "the property right in blood and tissue samples also evaporates once the sample is voluntarily given to a third party." *Id.* at 1075. It refused to recognize a claim of conversion because the blood and body tissue were "voluntary donations to medical research" and were donated "without any contemporaneous expectations of return." *Id.* at 1075-76.

In *Moore, supra.*, a patient undergoing treatment for hairy-cell leukemia had portions of his removed spleen, and samples of his blood, blood serum, skin, bone marrow aspirate and sperm utilized in medical research without his knowledge and/or consent. This research resulted in a cell line which was patented by the defendants. The defendants ultimately

entered into commercial agreements for the commercial development of the cell line and the resulting products. The patient plaintiff brought suit alleging conversion and breach of physician's disclosure obligations. As for his conversion claim,

> "[H]e theorizes that he continued to own his cells following their removal from his body, at least for the purpose of directing their use, and that he never consented to their use in potentially lucrative medical research. Thus, to complete Moore's argument, defendants' unauthorized use of his cells constitutes a conversion. As a result of the alleged conversion, Moore claims a proprietary interest in each of the products that any of the defendants might ever create from his cells or the patented cell line."

Id. at 134-35.[16]

The California Supreme Court did an exhaustive review of the law relating to the ownership and use of human biological materials. Having noted that Moore could not reasonably expect to retain possession of his excised cells, his claim for conversion had to rest upon retaining an ownership interest in them; however, the Court could find no reported judicial decision which would support a finding that he retained such an interest. *Id.* at 136-37. Instead the Court found that the laws governing human tissues, blood, and other biological materials

---

[16] For judicial economy and clarity, the Court will short cite to the California 3rd Reporter.

were better suited, than court cases dealing with the law of conversion, to deal with regulating their disposition. *Id.* at 137. "It is these specialized statutes, not the law of conversion, to which courts ordinarily should and do look for guidance on the disposition of human biological materials." *Id.*, at 137. One of the things making Moore's ownership claim "problematic" for the California Supreme Court was California's statutory law which severely limits a patient's control over excised cells. Essentially, California's laws negate any ownership rights a patient may have to excised cells since such biological materials are considered to be potentially hazardous biological waste materials and have to be disposed by a method approved by the state to protect the public health and safety. *Id.*, at 140. Ultimately, the California Supreme Court refused to bestow ownership rights to the patient/plaintiff for several reasons, including that it felt that even if a patient had "some limited right to control use of excised cells" such a "right" is already protected because "[A] fully informed patient may always withhold consent to treatment by a physician whose research plans the patient does not approve." *Id.*, at 141.

Both the Greenberg and the Moore cases found the research participant to be a "donor" who had parted with any semblance of ownership rights once their biological materials had been excised for medical research. Both courts reviewed relevant caselaw, addressed policy considerations, and addressed the implications of applicable federal and/or state laws dealing with biological materials.

The Court finds their analysis to be persuasive, and in light of its own review of applicable Missouri law, finds that WU has met its burden in establishing ownership of the subject materials and that the RPs have not put forth adequate evidence to challenge WU's ownership claim.

Furthermore, the Court finds that the RPs are "donors" and the subject biological materials constitute an inter vivos gift. The elements of an *inter vivos* gift are: 1) present intention of the donor to make a gift; 2) delivery of property by donor to donee; and 3) acceptance by donee whose ownership takes effect immediately and absolutely. *In re Herman Jerome True*, 285 B.R. 405, 413-14 (Bankrpcy Ct., W.D.Mo. 2002); *Wantuck v. United Savings and Loan Assn.*, 461 S.W.2d. 692, 694 (Mo. 1971); *In the Estate of Mary F. Campbell*, 939 S.W.2d. 558, 562 (Mo.App. 1997); *Duvall v. Henke*, 749 S.W.2d. 714, 716 (Mo.App. 1988). The person claiming that the gift exists has the burden of proving it with clear, cogent and convincing evidence. *In re Herman Jerome True*, at 414; *In the Estate of Mary F. Campbell*, at 562; *Duvall*, at 716.

"Specific language is not required to reflect present intent to make a gift on the part of donor." *Duvall*, at 716. The circumstances surrounding the donation can create an inference that the donor had the present intent to make the inter vivos gift to the donee. *Duvall*, at 716. In fact, "[c]onduct can be an enlightening ingredient in discerning intent." *In the Estate of Mary F. Campbell*, at 562.

The RPs all signed informed consent forms that clearly stated that they were agreeing to participate in medical research studies at WU. Tr.2:10. Many of the RPs were patients of WU doctors other than Dr. Catalona. Tr.1:83 Many of the RPs donated biological materials for research protocols having someone other than Dr. Catalona as the Principal Investigator. Plaintiff's Exhibits 56, 57, 58, 59; Tr.1:80-82; Tr.2:94-97. The informed consent forms typically bore the WU Medical Center logo. The informed consent forms stated that they were not valid without the stamp of approval of the WU Human Studies Committee. The forms advised the RPs that they could contact the Chairman of the WU Human Studies Committee with any concerns. The forms advised the participants what WU would do to protect their privacy and minimize the burdens of participating in the study.

Nowhere in the forms were RPs advised that they were entrusting their samples to Dr. Catalona only. In fact, in those research protocols wherein Dr. Catalona was the Principal Investigator, the forms merely stated: "You are invited to participate in a research study conducted by Dr. William J. Catalona and/or colleagues." Plaintiff's Exhibits 27, 61, 98; Catalona Exhibits UUU (McGurk and Ellis informed consent forms); Patients' Exhibit 1 - Ward informed consent form.

The Court finds that the RPs had the present intent to make *inter vivos* gifts; *i.e.* donations of their biological materials to WU for medical research.

Furthermore, the Court finds that for the reasons stated in establishing WU's ownership of the subject biological materials, WU took delivery of these materials and its acceptance of said materials immediately and absolutely effectuated WU's ownership of these materials.

Dr. Catalona and the RPs challenge WU's ownership rights by asserting the following grounds: 1) that no gift was made because of "exculpatory language" in the informed consent forms; 2) no gift was made to WU because the RPs "intended" for their samples to go with Dr. Catalona wherever he may go to conduct research; 3) that the RPs have retained their ownership rights to their excised biological materials because their "right to discontinue participation" includes a "right to control the samples' use" and a "right to transfer their samples" to a specific person or entity; 4) that the informed consents are invalid as being violative of certain ethical documents regarding human-subject research; and 5) the RPs made a bailment of their biological materials, not an *inter vivos* gift to WU. The Court has carefully reviewed each of these arguments and finds them meritless.

As stated before, an *inter vivos* gift only requires donative intent, delivery, and acceptance. There is no requirement that the gift be made pursuant to any written document. *See, Ridenour v. Duncan*, 246 SW.2d. 765, 769 (Mo. 1952) ("Language, written or spoken, expressing an intention to give does not constitute a gift unless the intention is executed by a complete and unconditional delivery of the subject matter or a delivery of a proper written instrument

evidencing the gift."); *In re Estate of Gladys Piper*, 676 S.W.2d. 897, 899 (Mo.App. 1984) (*citing Ridenour, supra.*). Since delivery of the subject biological materials was made and accepted by WU, the existence of the informed consent forms in inconsequential.

However, because of the nature of the gift, federal regulations require some form of informed consent. Dr. Catalona and the RPs argue that the presence of "exculpatory language" invalidates the informed consents and therefore, negates the gifts. In support of this argument, they point to the OPRR guidance document (Defendant's Exhibit Q). As this Court has already determined, this document is not legally-binding upon WU. It merely presents an opinion by the OPRR. regarding exculpatory language in informed consent forms and provides examples. These examples are not found in any of the federal regulations governing the GU Biorepository.

The governing federal regulation (as to informed consent), 45 C.F.R. §46.116, only prohibits exculpatory language in the form of a waiver or release from liability.

> "No informed consent, whether oral or written, may include any exculpatory language through which the subject or the representative is made to waive any of the subject's legal rights, or releases or appears to release the investigation, the sponsor, the institution or its agents from liability for negligence."

It is clear that the only legal obligation WU' had was not to include exculpatory language in its informed consent forms which waived any legal rights the RP may have or relieve any party from liability for negligence. Hearing testimony from all experts indicated that the research community consistently understood 45 C.F.R. §46.116 to bar exculpatory language involving releases from malpractice or other negligence. The OPRR's opinion as to exculpatory language does not govern the informed consents and therefore, does not affect the ownership interest of WU in the materials stored in the GU Biorepository.

Next, Dr. Catalona and the RPs argue that the RPs never intended for WIT to have ownership rights to the donated biological materials; *i.e.* that their intent was to retain such rights and continue to exercise their ownership rights as to the use and location of their excised biological materials.

As stated earlier, one of the elements of a gift is present donative intent. Present donative intent is assessed by determining if a gift was intended at the time of the initial transaction. *Michaelson v Wolf*, 261 S.W.2d. 918, 925 (Mo. 1953). A completed *inter vivos* gift cannot be revoked by the donor once the gift is delivered and accepted by the donee. *Clippard v. Pfefferkorn*, 168 S.W.3d. 616, 619 (Mo.App. 2005); *Donnelly v. Donnelly*, 951 S.W.2d. 650, 653 (Mo.App. 1997). "An afterthought of regret does not nullify the passage of title by a delivery and made by the grantor." *LeMehaute. et, al, v. LeMehaute*, 585 S.W.2d. 276, 281 (Mo.App. 1979).

The Court finds that the RPs had the present intent to donate their biological materials to WU to be maintained in the GU Repository. The informed consent forms repeatedly asserted WU's ownership of the donated materials and only listed Dr. Catalona as the Principal Investigator. Although the Court respects the testimony given by Messrs. Ward, Ellis, and McGurk, it was clear that these gentlemen all had a deep personal connection to Dr. Catalona, and believed that they owed their lives to him. The Court understands and appreciates these feelings but their testimony regarding intent, especially now after getting Dr. Catalona's letter, is suspect or at least, shows nothing more than an "afterthought of regret". There was no testimony by any of these gentlemen that they did not read nor understand the informed consent forms prior to signing. The forms spoke of "donation" and at least two (2) forms (Ward and McGurk) referenced a waiver of any claim to the excised body tissues. Since Ward, Ellis, and McGurk were presumably testifying on behalf of the eight (8) patients who joined the case, and reflect the opinion of all RPs who signed Dr. Catalona's "consent to transfer" form, the Court finds that all RPs who donated biological materials to the GU Repository, whether or not patients of Dr. Catalona, donated such materials with the present intent of making an *inter vivos* gift to WU.

Next, Dr. Catalona and the RPs argue that the RPs right to discontinue participation includes the right to continue control over the use and location of their excised biological materials. There is nothing stated in the governing federal regulations which

equates a right to discontinue participation with a right to control the disposition and use of the excised biological materials. The relevant testimony at the hearing indicated that only three (3) things happen when a RP chooses to "discontinue participation": 1) WU may destroy the sample; 2) WU may store the sample indefinitely without any further use; or 3) WU may remove all identifying markers and use the sample in exempt "anonymized" research Dr. Goodman and Dr. Clayton both agreed that research samples can be destroyed even without approval of the RP; and in fact, Dr. Catalona has done this on several occasions. No one questioned WU's ability to simply store the samples indefinitely after a RP discontinues participation in a research project. Finally, Drs. Ludbrook and Prentice both testified that anonymization is a response available to WU when a RP chooses to discontinue participation in research.[17]

The Court finds that the right to discontinue participation in a research project means nothing more that the RP has chosen not to provide any more biological materials pursuant to one or more research protocols; *i.e.*, not to make any more *inter*

---

[17] Although not particularly relevant to the matter at hand, the Court does note that even Dr. Catalona, as a researcher at Northwestern University, testified that he is using informed consent forms which only state two (2) options upon a RP's decision to withdraw participation: 1) destruction of the sample or 2) anonymization of the sample. Northwestern University's consent form interestingly does not provide the third option advocated by Dr. Catalona and the RPs; *i.e.* return of the sample to the RP or transfer of the sample to a location chosen by the RP.

vivos gifts of donated biological materials to WU. Nothing more can or should be read into this right possessed by the RPs at all times.

Next, Dr. Catalona and the RPs argue that WU's refusal to transfer the donated biological materials violates the Belmont Report, the Declaration of Helsinki, and the Nuremberg Code. The Belmont Report is the 1979 report of a Presidential Commission that summarizes the basic ethical principles underlying the conduct of biomedical and behavioral human subject research. Defendant's Exhibit MMMM. The Declaration of Helsinki is a statement of ethical principles to provide guidance to physicians in connection with human subject research. Defendant's Exhibit NNNN. The Nuremberg Code, developed as a result of the war criminal trials before the Nuremberg Military Tribunals following World War II, and in response to the human experimentation experiments of Nazi Germany, similarly deals with ethical principles governing human subject research. Defendant's Exhibit 0000. All of these documents set forth international ethical principles relating to human subject research.

Although WU does have an agreement with DHHS to be guided by the ethical principles in the Belmont Report[18], said agreement fails to provide a basis for the claims of Dr. Catalona and/or the RPs wishing to transfer their samples (including the eight patients who are parties to this lawsuit) because they are not parties to or the third-party

---

[18] Defendant's Exhibit I.

beneficiaries of this government contract. They have no private cause of action to enforce the terms of the contract. *See, Wright y_ Fred Hutchinson Cancer Research Center*, 269 F.Supp.2d. 1286, 1290 (W.D.Wash. 2002).

Furthermore, the Court finds that Dr. Catalona and the RPs have failed to make an adequate showing that the refusal of WU to transfer the subject samples constitutes a violation of the DHHS Assurance Contract; and therefore, a violation of the Belmont Report.

There is no private right of action for an alleged violation of international law for the protection of human research subjects based upon the Declaration of Helsinki and the Nuremberg Code. *White v. Paulsen*, 997 F.Supp. 1380, 1383 (E.D.Wash. 1998); *Hoover v. West Virginia Dept. of Health and Human Services*, 984 F.Supp. 978, 980 (S.D.W.Va. 1997) *aff'd* 129 F.3d. 1259 (4th Cir. 1997); *see also, AbdullahiL et. al. v. Pfizer, Inc.*, 2005 WL 1870811 (S.D.N.Y. 2005).[19] Furthermore, this Court agrees with the conclusions reached by its fellow district courts in Michigan and Oklahoma that the standard in the United States for conducting research on human subjects is contained in the Code of Federal Regulations and therefore United States federal courts have no need to resort to international law to impute a standard. *Ammend v. Biopart, Inc.*, 322

---

[19] Although it is not this Court's common practice to cite to unpublished opinions, it will do so in the rare instance wherein such opinion offers guidance helpful to this Court on a particular issue.

F.Supp.2d. 848, 872-73 (W.D.Wash. 2004); *Robertson v. McGee*, 2002 WL 535045 (N.D. Okla 2002).

Finally, Dr. Catalona and the RPs assert that the RPs did not make a "gift" of the subject biological materials but instead made a "bailment" and that WU stands only in the position as a bailee.[20] This argument fails for the simple reason that when a "gift" is made, the giftor/donor has no expectation of getting the "gift" back; however, when a "bailment" is made, the bailor has every expectation of receiving back the subject of the bailment. A bailment is made on the condition that the property (after delivery by bailor and acceptance by bailee) be restored to the bailor according to his/her directions as soon as the purpose for the bailment ceases. *Seitz v. Lemav Bank & Trust Co.*, 959 S.W.2d. 458, 461 (Mo. 1998); *Stone v. Crown Diversified Indus., Corp.*, at 669. There was no evidence presented to this Court that any of the RPs, including the three (e) RPs that testified, had ever informed WU, at the time of "delivery" of the subject biological materials that they wanted the samples returned to them. Furthermore, the RPs could not have had a reasonable expectation of restoration of the subject biological materials to them because applicable federal and state regulations governing the disposal of medical waste prohibit the return of such biological materials to the RPs. *See*, 29 C.F.R.

---

[20] Actually, Dr. Catalona and the RPs assert an "implied bailment": "A contract for bailment may be written, oral, express, or implied." *D.S. Sifers Corp. v. Hallak, et. al.*,, 46 S.W.3d. 11, 16 (Mo.App. 2001) quoting *Stone v. Crown Diversified Indus. Corp.*, 9 S.w.3d. 659, 669 (Mo.App. 1999).

§1910.1030; §§ 260.200, 260.203 R.S.Mo.; 10 C.S.R. §80-7.010.

Finally, the medical research community itself has never considered the relationship between an RP and a medical research institution to be one of bailment. All the experts testified that they knew of no instance wherein a research participant had his/her samples returned to them. Even Dr. Catalona testified that he could only recall one or two instances wherein a biological sample had been returned to a patient, for clinical purposes.[21] The Court finds that no implied bailment existed, at any time, in connection with any RP, as to the samples stored in the GU Repository between an RP and WU.

In connection with their argument that the RPs "own" their excised biological materials and can transfer them to any institution or person of their choosing, Dr. Catalona advances the notion that his letter and "Medical Consent and Authorization" form allegedly signed by approximately 6000 RPs effectively legally carries out the RPs' "right to discontinue participation". However, one views this document(s), it in no way provides a legal vehicle by which any RP can "discontinue participation" in any research protocol at WU.

Every expert and even Dr. Catalona testified that the letter/form did not constitute "informed consent"

---

[21] Dr. Catalona's testimony was that out of approximately 40,000 research participants he had one or two who requested their samples back and the samples were processed and actually sent to a clinical laboratory (of the RP's choosing), not the RP's home. Tr.2:I6-17.

pursuant to the applicable federal regulations. It was never submitted to any IRB, either at WU or Northwestern University, for prior approval. Contrary to Dr. Catalona's opinion, the Court finds that his communication to the RPs was a "change" to his research protocols. He was no longer the Principal Investigator on any of the studies involving the samples he sought to have transferred; he was no longer an employee of WU nor continuing to conduct his research at WU, and Northwestern University (at that time) had not approved any "new" research protocols for him which would involve use of the biological materials he wanted transferred. Furthermore, the context which this form was sent is troubling to the Court. He sent it to RPs, many of whom were his patients and emotionally tied to him, advising them of his move, of his desire to continue his consultation/treatment practice, and then describing his need to use these samples to further his help to them. Such a communication smacks of undue influence. Quite simply, the letter and form did not act in any legal authoritative manner to effectuate a transfer of the subject biological materials as part of a RP's right to discontinue participation.

As a final note, the Court wishes to address the possible (if not, probable) public policy ramifications of Dr. Catalona and the RP's position. The arnicus brief filed by the Association of American Medical Colleges[22] succinctly mirrors the Court's concerns Currently, these materials are housed and

---

[22] Document #106, filed April 6, 2006.

maintained by institutions federally and state regulated. A "check and balance" system is in place to monitor the research being conducted using these materials. The safety and welfare of human subject participants is protected through a variety of legal and professional standards administered by committees of persons schooled in the fields most privy to the needs of the medical/science community. Medical research can only advance if access to these materials to the scientific community is not thwarted by private agendas. If left unregulated and to the whims of a RP, these highly-prized biological materials would become nothing more than chattel going to the highest bidder. It would no longer be a question of the importance of the research protocol to public health, but rather who can pay the most. Selling excised tissue or DNA on E-Bay would become as commonplace as selling your old television on E-Bay. The integrity and utility of all biorepositories would be seriously threatened if RPs could move their samples from institution to institution any time they wanted. No longer could research protocols rely on aggregate collections since individual samples would come and go. Accountability would no longer exist since institutions would merely be warehouses filling purchase orders.

More alarming is the great potential for prejudicial influences into medical research. Allowing an RP to choose who can have the sample, where the sample will be stored, and/or how the sample can be used is tantamount to a blood donor being able to dictate that his/her blood can only be

transfused into a person of a certain ethnic background, or a donated kidney being transplanted only into a woman or man. This kind of "selectiveness" is repugnant to any ethical code which promotes medical research to help all of mankind.

Accordingly, the Court funds that 1) defendants; *i.e.* Dr. William Catalona and the eight (8) research participants who are parties to this action, have failed to demonstrate that they are entitled to any injunctive relief; 2) that plaintiff Washington University owns all biological materials, including but not limited to blood, tissue, and DNA samples, in the GU Repository; 3) that neither Dr. William Catalona nor any research participant in connection with any research protocol conducted under the auspices of Washington University has any ownership or proprietary interest in the biological samples housed in the GU Repository; and 4) that the "Medical Consent & Authorization" forms authored by Dr. William Catalans. and either directly or indirectly delivered to any research participant and signed by any research participant are void and ineffective to transfer ownership and/or possession of any biological samples housed in the GU Repository to Dr. William Catalona, Northwestern University, any other research facility/institution, or any or all research participants.[23]

---

[23] Nothing in this opinion or the Court's ultimate findings shall be construed to prohibit Dr. William Catalona from seeking said samples through the ordinary and regular channels

Dated this 31st day of March, 2006.

---

normally available to any medical researcher requesting approval of a research protocol from WU.

Appendix D

UNITED STATES DISTRICT COURT
EASTERN DISTRICT OF MISSOURI
EASTERN DIVISION

Case No. 4:03CV1065SNL

THE WASHINGTON UNIVERSITY,
Plaintiff,

vs.

WILLIAM J. CATALONA, ET. AL.,
Defendants.

ORDER

In accordance with the memorandum opinion filed herein this date,

IT IS HEREBY **ORDERED** that plaintiff Washington University's motion for summary judgment (#24), filed January 7, 2004 be and is GRANTED. Judgment is hereby entered in favor of Washington University and against defendant William J. Catalona and the Intervener Defendants Richard N. Ward, Thomas A. McGurk, Jr., Luis Garcia, Antonio Castro, Phillip Wilard, Ivan Parron, James D. Ellis, and Mike Missios on the merits of plaintiff Washington University's declaratory judgment complaint.

IT IS **FURTHER** ORDERED that defendant Catalona's motion requesting court order that plaintiff not utilize, disseminate. transfer, dissipate, de-identify andlor destroy serum and genetic

material at issue (#39), filed June 8, 2004 be and is DENIED.

IT IS FURTHER ORDERED that defendant Catalona's counterclaim be and is **DENIED.**

IT IS **FURTHER** ORDERED that this Court declares plaintiff Washington University the true and rightful owner and possessor of all biological materials, including but not limited to blood, tissue, and DNA samples, currently and in the future, stored and maintained in the GU Biorepository; and that neither Dr. William Catalona nor any research participant in connection with any past, present, or future protocol conducted under the auspices of Washington University has any ownership or proprietary interest in the said biological materials housed in the GU Biorepository. Washington University is free to use said biological materials for appropriate research projects and to transfer such materials to qualified researchers at other institutions pursuant to Material Transfer Agreements recognizing Washington University's ownership of the said materials. Any person or entity interfering with Washington University's ownership and/or possessory rights pertaining to said materials, or with Washington University's relationship with the NCI researchers or any other qualified researchers seeking access to the GU Biorepository materials, may be held in contempt of this order.

IT IS FINALLY ORDERED that nothing in this order and/or memorandum opinion, filed herein this date, shall be construed to prohibit Dr. William

Catalona, from seeking access to the said biological materials stored in the GU Biorepository through the ordinary and regular administrative channels normally available to any medical researcher requesting approval of a research protocol and/or use of said materials in an approved research protocol outside of Washington University.

Dated this 31st day of March, 2006

Sup. Ct. R. 10 14

INTRODUCTION

Respondent Washington University respectfully opposes the Petitions for a Writ of Certiorari in this case. The court of appeals unanimously affirmed the district court's decision that, as a matter of Missouri property law, the University owns tissue and blood samples in the world's largest biorepository for prostate cancer research. Leading institutions and associations in the fields of medical research and higher education, including (among others) the American Cancer Society, the American Council on Education, the Association of American Medical Colleges, Johns Hopkins University, and the Mayo Clinic filed briefs as amici curiae in the court of appeals in support of the University, arguing that the position advocated by Petitioners would have profoundly harmful consequences for medical research.

The Petitions should be denied on multiple grounds:

First, the court of appeals decided an issue of state law. This Court rarely grants review of state law questions, and Petitioners have not even asked the Court to review the state-law issue in this case.

Second, the preemption question framed by the Petitioners was neither decided by nor properly presented to the courts below. Petitioners' briefs never mentioned the word "preemption." Instead, Petitioners told the courts they were "pressing state common law rights," not federal rights. Ward C.A. Reply Br. 12 n.6.

Third, the federal issue Petitioners seek to raise would not change the outcome of this case. The court of appeals found that there was ample evidence of donative intent apart from language challenged by Petitioners that appears in some of the informed consent documents, and thus the court had no need to decide whether the informed consent documents included so-called "exculpatory language" prohibited by federal regulations.

Fourth, there is no conflict in the circuits on the preemption question that Petitioners seek to raise or on the state property law issue that the courts below actually decided. Only a few courts have considered the issue of ownership of human tissues used for medical research, and they have reached exactly the same result as the courts in this case.

Fifth, the federal regulations on which Petitioners seek to base their preemption argument do not provide a private right of action. The Department of Health and Human Services ("HHS"), the federal agency that promulgated the regulations, has full authority to interpret, enforce, and amend the regulations. It has not endorsed Petitioners' preemption argument, and has recognized that individuals are permitted to donate human tissue for research purposes.

Sixth, the decision of the court of appeals is correct. Petitioners' preemption argument proves too much, because it would effectively prohibit donations of human biological materials for medical research. Neither Congress nor the agency could have intended this result, and in fact the agency has

stated that its regulations do not prohibit human tissue donations for research purposes.

Seventh, the court of appeals' decision does not alter existing law, and will not have the adverse consequences predicted by Petitioners and their amicus. To the contrary, it is Petitioners' position that would harm medical research by inhibiting researchers from sharing samples and encouraging efforts to divert samples away from basic medical research into for-profit activities. Petitioners seek to raise issues that are not presented by the facts of this case, and in doing so ignore the fact that the University's use of samples is comprehensively regulated by a federal agency and an Institutional Review Board required by federal regulations. See 45 C.F.R. §§ 46.102, 46.109.

For each of these reasons, the Petitions should be denied.

STATEMENT

1. Respondent Washington University is a leading private research university in St. Louis, Missouri. Pet. App. 3a, 22a.[1] The University's Medical School includes a Division of Urologic Surgery that conducts research on urologic diseases such as prostate cancer. *Id.* at 4a.

Petitioner William Catalona, a leading prostate cancer surgeon, was employed by Washington University from 1976 to 2003 and served

---

[1] References to "Pet. App." refer to the appendix to the Catalona Petition, No. 07-521.

as Chief of the Division of Urologic Surgery from 1984 to 1998. Pet. App. 4a. In 1983, Dr. Catalona and his colleagues began collecting human tissue samples for use in prostate cancer research. *Id.* Over a period of years, this collection grew to become the world's largest biorepository of human blood and tissue samples for prostate cancer research. *Id.* The biorepository contains approximately 3,500 prostate tissue samples from patients of University physicians including Dr. Catalona. *Id.* at 7a. It also includes approximately 100,000 blood samples, most of which were donated by volunteers who were not patients of any University physician. *Id.* In addition to blood and tissue samples, the biorepository includes DNA samples donated by patients of various University physicians and their relatives. *Id.* Of the approximately 30,000 individuals who contributed samples to the biorepository (known as "research participants" or "RPs"), no more than 10 percent were patients of Dr. Catalona. *Id.*

The biorepository is housed in University buildings, administered by University employees, and funded primarily with University money. Pet. App. 4a. The University has exercised exclusive control over the samples, and is solely responsible for deciding who can access and use the biorepository. *Id.* at 4a, 24a.

The University's use of samples in the biorepository is supervised and regulated by a federal agency, the Office for Human Research Protections ("OHRP") within HHS. HHS has promulgated federal regulations, known as the "Common Rule," that govern the conduct of federally-funded human subject research. The Common Rule

requires the University to obtain informed consent from individuals who donate tissue samples for use in medical research. *See* 45 C.F.R. §§ 46.116, 46.117. In addition, the University is required to establish an Institutional Review Board ("IRB") to review and approve research protocols. *See* 45 C.F.R. §§ 46.102; 46.109; *see generally* Erica Heath, "The History, Function, and Future of Independent Institutional Review Boards," published in National Bioethics Advisory Commission, *Ethical And Policy Issues In Research Involving Human Participants*, Vol. II (2001).

RPs contributing samples to the biorepository signed consent documents that typically bore the University Medical Center's logo and used the term "donation" to describe the transfer of the sample. Pet. App. 5a. The consent document and a University brochure explained that biological samples "may be used for research with our collaborators at [the University], other institutions, or companies." *Id.* The documents typically stated that, by participating, the RP "make[s] a free and generous gift of your [blood, tissue, and/or DNA] to research that may benefit others." *Id.* at 26a. RPs were informed that they could not "claim ownership rights to any medical or scientific product that results from research with your tissue." *Id.* at 6a. The informed consent documents stated that the collection of samples is for medical research and not for patient care. *Id.* at 26a.

Dr. Catalona and other Washington University physicians have conducted numerous prostate cancer research studies using samples from the biorepository. Pet. App. 4a-5a. Dr. Catalona was

designated as the principal investigator for some but not all of the research studies. *Id.* When Dr. Catalona was listed as principal investigator, the informed consent documents stated that the research study would be conducted by Dr. Catalona "and/or colleagues." *Id.* at 42a. Other research institutions requested and received samples from the biorepository to conduct research projects either in partnership with or independent of the University. *Id.* at 7a. While employed at the University, Dr. Catalona repeatedly transferred biorepository materials to other research institutions pursuant to material transfer agreements (MTAs). *Id.* Numerous MTAs signed by Dr. Catalona acknowledge the University's ownership of the biological samples. *Id.* The MTAs are in accordance with the University's written Intellectual Property Policy, which provides that tangible research property is owned by the University. *Id.* at 16a n.8.

2. In early 2003, Dr. Catalona accepted a position at Northwestern University. Pet. App. 7a. On February 18, 2003, he sent a letter to all RPs who had contributed samples to the biorepository (including many RPs who had never been his patients) informing them of his planned departure from the University, his continued availability for consultation and treatment, and his plans for prostate cancer research. *Id.* The letter states "[y]ou have entrusted me with samples, and I have used them in collaborative research that will help in your future medical care." *Id.* at 33a. Attached to the letter was a "Medical Consent & Authorization" form for the RPs to sign and return. The form stated: "Please release all of my samples to Dr. Catalona at

Northwestern University upon his request." *Id.* Approximately 6,000 RPs returned the completed form to Dr. Catalona; about 24,000 RPs did not. *Id.*

At the time Petitioner Catalona sent the letter and release form, he was an employee of the University. Pet. App. 33a-34a. He did not obtain approval from the University's Institutional Review Board ("IRB") (or the IRB at Northwestern University) to send the letter or the release form. *Id.* at 34a.

3. This case began after Dr. Catalona contacted the National Cancer Institute to warn them that he was disputing ownership rights to samples in the prostate cancer biorepository. University C.A. App. 2:256-57 & 3:553.[2] As a result of Dr. Catalona's action, NCI returned to the University more than 400 samples from the biorepository that were to be used in research intended to develop an improved test for prostate cancer. *Id.*

In August 2003, the University filed a declaratory judgment action seeking to confirm its ownership of the blood and tissue samples in the biorepository. Pet. App. 9a. The University's four-count complaint raised three state law claims and a claim under the federal Health Insurance Portability and Accountability Act of 1996 ("HIPAA") that was abandoned prior to a ruling by the district court. University C.A. App. 5:1002-18.

---

[2] References to "University C.A. App." refer to the appendix to Respondent's brief filed in the Eighth Circuit.

Petitioner Catalona filed a six-count counterclaim raising five state-law claims and a claim for a "violation of free speech" that he did not pursue. Neither the University's complaint nor Dr. Catalona's counterclaim mentions preemption. University C.A. App. 5:1002-18, 1033-58.

Dr. Catalona asked the court to issue an order prohibiting the University from using, transferring, or destroying tissue samples in the biorepository during the pendency of the litigation. Pet. App. 9a. The district court issued the order the next day, but subsequently withdrew it on the ground that it amounted to a preliminary injunction, and scheduled a hearing on whether to issue a permanent injunction. *Id.*

In February 2005, the court granted the motion of the Ward Petitioners, all of whom were RPs and patients of Dr. Catalona, to intervene in the case as defendants. The Ward Petitioners' answer and affirmative defenses likewise did not mention federal preemption. University C.A. App. 6:1355-65.

Following a three-day hearing, the district court (E.D. Mo., Limbaugh, J.) denied Petitioner Catalona's motion for a permanent injunction and entered judgment for the University. Pet. App. 19a-57a. The district court found that the University has been in exclusive possession of the biological materials at all times, has exercised exclusive control over the materials, and has continually asserted its ownership interest in the materials. *Id.* at 35a-37a. The court agreed with two prior cases holding a research participant to be a "'donor' who had parted with any semblance of ownership rights once their biological materials had been excised for medical

research." *Id.* at 41a (citing *Moore v. Regents of Univ. of California*, 793 P.2d 479, 487, 488-89 (Cal. 1990); *Greenberg v. Miami Children's Hosp. Research Inst.*, 264 F. Supp. 2d 1064 (S.D. Fla. 2003)). In addition to holding that the University is the owner of the biological materials under Missouri law, the court held that the RPs had made an *inter vivos* gift of the materials to the University and had not entered into a bailment. *Id.* at 41a-49a.

The district court determined that the informed consent documents signed by the RPs complied with a provision in the federal Common Rule barring "exculpatory language through which the subject or the representative is made to waive any of the subject's legal rights, or releases or appears to release the investigator, the sponsor, the institution, or its agents from liability for negligence." Pet. App. 44a, quoting 45 C.F.R. § 46.116. Relying on expert testimony, the court found that the research community understands this provision to prohibit language in informed consent documents that amounts to a release from malpractice or negligence, and that there is no such language in the University's informed consent documents. Pet. App. 45a. The district court also held that the RPs' right to discontinue participation in the research does not include "a right to control the disposition and use of the excised biological materials." Pet. App. 46a-47a.

The district court further found that Dr. Catalona's "Medical Consent and Authorization" form sent to RPs had not been properly approved by an IRB and did not constitute informed consent. Pet. App. 51a. The court commented that "the context in

which this form was sent is troubling" and "smacks of undue influence." *Id.* at 51a-52a.

The court noted that the biorepository is subject to "a 'check and balance' system" that monitors use of the materials for research and protects the safety and welfare of RPs. Pet. App. 52a. The court observed, "Medical research can only advance if access to these materials to the scientific community is not thwarted by private agendas." *Id.* Under Petitioners' proposed approach, research institutions could no longer rely on aggregate collections of biological materials, because "samples would come and go." *Id.* at 53a. In this situation, "[i]t would no longer be a question of the importance of the research protocol to public health, but rather who can pay the most." *Id.* at 52a.

3. The Eighth Circuit (Wollman, Riley, Shepherd, JJ) affirmed. Pet. App. 1a-18a. The court of appeals held that "[u]nder the facts of this case," individuals who make an informed decision to contribute biological materials to a research institution for medical research do not retain an ownership interest that allows them to direct that the materials be transferred to a third party. *Id.* at 11a. To decide this issue, the court "look[ed] to the substantive law of Missouri." *Id.* Missouri law defines an *inter vivos* gift as "'a voluntary transfer of property by the owner to another, without any consideration or compensation as an incentive or motive for the transaction.'" *Id.* (quoting *Pilkington v. Wheat*, 51 S.W.2d 42, 44 (Mo. 1932)).

Under Missouri law, the party claiming an inter vivos gift has the burden of showing, by clear and convincing evidence: "(1) present intent of the

donor to make a gift, (2) delivery of the property by the donor to the donee, and (3) acceptance of the gift by the donee, whose ownership takes effect immediately and absolutely." Pet. App. 11a-12a (citing *Clippard v. Pfefferkorn*, 168 S.W.3d 616, 618 (Mo. Ct. App. 2005)). The court found that the second element "unquestionably" was satisfied in this case, and therefore it focused on the other two requirements. *Id.*

The court noted that "[n]o specific language is required to reflect the donor's present intent to make a gift," and such an intent may be inferred from the surrounding circumstances. Pet. App. 12a (citing *Duvall v. Henke*, 749 S.W.2d 714, 716 (Mo. Ct. App. 1988)). The court of appeals agreed with the district court that "the circumstances surrounding the RPs' decisions to participate in genetic cancer research demonstrate the status of the RPs as donors." *Id.* That evidence included the following: (i) RPs were required to read and sign a consent document that bore the University's logo and described the RPs' participation as a "donation" of tissue or blood samples; (ii) RPs received a brochure that described the donations as "a free and generous gift of [biological materials] to research that may benefit society"; and (iii) RPs were specifically informed that their samples "may be used for research with our collaborators at [the University], other institutions, or companies." *Id.* at 5a, 12a-13a. In addition, the University's Intellectual Property policy provides that "tangible research property" "shall be owned by the University," and Dr. Catalona signed numerous documents acknowledging that the University is the owner of the samples in the biorepository. *Id.* at 15a-

16a & n.8. Moreover, Dr. Catalona routinely ordered that samples be destroyed to free up storage space, without obtaining additional consent from RPs. *Id.* Because the court of appeals was persuaded that this evidence demonstrated that the RPs intended to make an *inter vivos* gift to the University, it found it unnecessary to consider the validity or effect of additional language in some of the consent documents which stated: "By agreeing to participate in this study, you agree to waive any claim you might have to the body tissues that you donate." Pet. App. 15a n7.

The court of appeals also held that the University had accepted the RPs' gift. The court noted that, under Missouri law, a gift "may be subject to a condition allowing the donor to exercise a particular revocation right in the future." Pet. App. 14a (citing *Clippard*, 168 S.W.3d at 619; *Franklin v. Moss*, 101 S.W.2d 711, 714 (Mo. 1937)). If that were not so, the court observed, many charitable donations would be impossible. Here, RPs may decline to answer additional questions or provide additional samples, may request that their donated biological materials no longer be used for medical research and (in some consent documents) may request that donated samples be destroyed. Pet. App. 14a. The court concluded: "[I]t is evident that the RPs did not retain the right to revoke and physically repossess the donated biological materials. Nor did the RPs retain the right to direct or authorize the use, transfer, or destination of the biological materials after their donation." *Id.* at 15a.

The court found no evidence that RPs were told that they could request the return of donated

samples. To the contrary, RPs who underwent surgery signed surgical consent documents providing that tissues removed during surgery and not used for clinical purposes would be destroyed as hazardous medical waste. Pet. App. 16a-17a. In addition, returning samples to RPs would violate state and federal laws governing the disposal of hazardous substances and infectious waste. *Id.* at 16a.

4. Petitioners filed an application to stay the Eighth Circuit's mandate pending the filing and disposition of a petition for a writ of certiorari. The Eighth Circuit stayed its mandate only for a period of 30 days to allow Petitioners time to seek a stay from this Court. In August 2007, Justice Alito, as Circuit Justice for the Eighth Circuit, denied Petitioners' application for a stay.

REASONS WHY THE PETITIONS SHOULD BE DENIED

There are multiple reasons for denying the petitions for certiorari in this case: the court of appeals decided an issue of state law; the preemption issue that Petitioners seek to raise in this Court was not properly raised or decided in the courts below; the preemption issue would not change the outcome of this case; there is no conflict in the circuits; and the federal regulations cited by Petitioners do not create a private right of action, and the federal agency that enforces the regulations has taken no position on Petitioners' preemption argument. In addition, the decision of the court of appeals is correct and will not have the adverse consequences suggested by Petitioners and their amicus. To the contrary, adopting Petitioners' position would significantly harm medical research.

I. The Petitions Should Be Denied, On Multiple Grounds.

1. The court of appeals held, as a matter of state law, that the RPs made *inter vivos* gifts of blood and tissue samples to the University. In deciding that question, the court "look[ed] to the substantive law of Missouri." Pet. App. 11a. The court's decision relies entirely on decisions of Missouri state courts applying Missouri state law. *Id.* at 11a-14a. The court of appeals did not decide any federal question, let alone a preemption question. To the contrary, the court expressly found "it unnecessary to address" the meaning or effect of a provision in a federal regulation that prohibits "exculpatory language" in informed consent documents. *Id.* at 15a n.7. The court explained that there was no need to decide this issue because other evidence "convinces us the RPs intended to make inter vivos gifts of their materials." *Id.*

This Court rarely grants a petition for certiorari to review an issue of state law. *See Huddleston v. Dwyer*, 322 U.S. 232, 237 (1944) ("[O]rdinarily we accept and therefore do not review, save in exceptional cases, the considered determination of questions of state law by the intermediate federal appellate courts."); *see also* Sup. Ct. R. 10(c) (Court may grant review to decide "an important question of *federal* law") (emphasis added). Indeed, Petitioners do not even ask this Court to review the state law issue decided by the courts below. That issue plainly warrants no further review.

2. Petitioners acknowledge that the federal preemption question they are asking this Court to

decide was neither addressed nor decided by the court of appeals. *See* Catalona Pet. 14 (court of appeals "refus[ed] to address" preemption argument); Ward Pet. 11 (court of appeals' refusal to address preemption argument was "inexplicable"). In fact, the lower courts did not decide a federal preemption question because Petitioners failed to raise it.

The word "preemption" did not appear anywhere in any of Petitioners' briefs filed in the court of appeals or the district court. Nor did Petitioners cite *Hillsborough County v. Automated Med. Labs., Inc.*, 471 U.S. 707 (1985), *Hines v. Davidowitz*, 312 U.S. 52 (1941), *Geier v. America Honda*, 529 U.S. 861 (2000), or any of the other federal preemption cases cited in their petitions to this Court. Instead, Petitioner Catalona stated that "Missouri law govern[s] the issue of ownership at stake in this case." Catalona C.A. Br. 15. The Ward Petitioners stated: "Missouri law determines who owns the Patient Tissue," and "Missouri common law and statutes control. On this the parties agree." University C.A. App. 6:1490. Petitioners expressly told the court of appeals that they were "pressing state common law rights" rather than any rights created by federal law, and that federal regulations merely "provide[] an interpretive guide in this case rather than an independent basis for the RPs' rights." Ward C.A. Reply Br. 12 n.6. Petitioners' statements to the lower courts tracked their legal claims, which rested entirely on state law (except for a First Amendment speech claim that Petitioners abandoned). University C.A. App. 5:1003; 5:1049-

51.[3] Although Petitioners now assert that they raised the preemption issue in the lower courts, the record shows otherwise.

This Court generally does not grant review of questions that were not properly presented to the courts below. Where a question has not been properly raised in the court below, "the record is very likely to be inadequate." *Cardinale v. Louisiana*, 394 U.S. 437, 439 (1969). A different rule would allow litigants to sandbag the lower courts and deprive this Court of the benefit of the lower courts' analysis of the issue. Accordingly, the Court should decline Petitioners' invitation to decide a preemption issue that was neither decided nor properly presented to the courts below.

3. Petitioners' argument would not change the outcome of this case. In the court of appeals, Petitioners cited the Common Rule in an effort to neutralize statements in some of the informed consent documents that "[b]y agreeing to participate in this study, you agree to waive any claim you might have to the body tissues that you donate." Pet. App. 15a n.7. Petitioners contended that this language was contrary to a provision of the Common Rule stating that informed consent forms may not contain "any exculpatory language through which the subject or representative is made to waive or appear to waive any of the subject's legal rights, or releases or

---

[3] In the lower courts, Petitioners argued that the samples are governed by Missouri's law of bailments. That argument is inconsistent with Petitioners' current argument that federal regulations displace state property law.

appears to release the investigator, the sponsor, the institution or its agents from liability for negligence." 45 C.F.R. § 46.116. The court expressly held that it had no need to consider whether the language at issue was permissible under the Common Rule, because other "circumstances surrounding the RPs' voluntary decision to donate their biological materials" independently "convince[] us the RPs intended to make inter vivos gifts of their materials." Pet. App. 15a n.7. *See also id.* at 12a ("No specific language is required to reflect the donor's present intent to make a gift; in fact, the circumstances surrounding the contribution may create an inter vivos gift.") (citation omitted). Here, the circumstances surrounding the contribution included the facts that samples may be consumed during research and shared with other researchers, the limitations imposed by laws governing the disposal of medical waste, and the RPs' testimony that they had no expectation the samples would ever be returned to them. *See* Pet. App. 50a (no evidence that any of the RPs informed the University that they wanted the samples returned; RPs "could not have had a reasonable expectation of restoration" because of laws governing the disposal of medical waste); University C.A. App. 2:78 (Petitioner Ward's testimony that he did not expect tissue to be returned).[4]

---

[4] If an informed consent document contains "exculpatory language," the remedy is to strike the exculpatory language, not to set aside the consent or the gift. In the few instances in which OHRP has determined that an informed consent document includes exculpatory language, it has simply directed (...continued)

4. There is no conflict in the courts of appeals on *either* the state law issue that the courts actually decided or the federal preemption issue that Petitioners now seek to raise. Only two other published decisions have addressed ownership of human tissue used in medical research, and both decisions reach exactly the conclusion that the Eighth Circuit reached here: research participants do not continue to own human tissues removed from their bodies and used for medical research.

In *Moore v. Regents of University of California*, 793 P.2d 479, 487, 488-89 (Cal. 1990), the California Supreme Court rejected the plaintiff's contention that "he continued to own his cells following their removal from his body, at least for the purpose of directing their use." The court found that the plaintiff, like the RPs here, "clearly did not expect to retain possession of his cells following their removal." *Id.* at 489. The *Moore* court, like the court of appeals in this case, recognized that state statutes governing medical waste severely restrict "a patient's control over excised cells," and thus eliminate "many of the rights ordinarily attached to property." *Id.* at 489, 492. The California Supreme Court held that the plaintiff had cognizable legal claims arising out

---

that the waiver language be removed from the document. *See* Letter from Carol J. Weil, Compliance Oversight Coordinator, Division of Human Subject Protections, Office for Human Research Protections, to John C. McDonald, Chancellor/Dean, Louisiana State University Health Science Center Shreveport (Jan. 25, 2006), *available at* http://www.hhs.gov/ohrp/detrm_letrs/YR06/jan06a.pdf.

of the special circumstances of that case, but they did not include a claim to ownership of the cells.

Moore is particularly instructive because the plaintiff had a considerably *stronger* argument than the Petitioners in this case. Unlike the Ward Petitioners, the plaintiff in *Moore* was not informed that the tissues removed from his body would be used for medical research, and he did not consent to any research. Moreover, the physician in *Moore* sought to profit financially from research conducted with the plaintiff's tissues. In contrast, the RPs in this case gave their informed consent to use of the blood and tissue samples for prostate cancer research, and, far from profiting, the University has expended substantial amounts of money to develop and maintain the biorepository as a resource for prostate cancer researchers.

In the only other reported decision on point, the court reached the same result, holding that RPs "have no cognizable property interest in body tissue and genetic matter donated for research." *Greenberg v. Miami Children's Hosp. Research Inst.*, 264 F. Supp. 2d 1064, 1074 (S.D. Fla. 2003). The court concluded that the RPs' "property right in blood and tissue samples . . . evaporates once the sample is voluntarily given to a third party." *Id.* at 1075.

Tellingly, Petitioners do not cite *Moore* or *Greenberg*. Instead, Petitioner Catalona relies on two cases that obviously do not conflict with the decision in this case. In *Grimes v. Kennedy Krieger Institute, Inc.*, 782 A.2d 807 (Md. 2001), the court did not decide a preemption issue or any issue involving ownership of human tissues used for medical research. Instead, the court held that

parents and other surrogates generally cannot consent to the participation of a child in nontherapeutic research in which there is a risk of injury or damage to the health of the child. In so holding, the court noted that the researchers were obligated to obtain informed consent pursuant to 45 C.F.R. § 46.407, and concluded that this federal duty "translates into a duty of care" under state law. *Id.* at 849. The issue decided in *Grimes* is not the issue in this case, and there is no conflict between the two decisions.

The same is true of *Kraemer-Katz v. United States Public Health Service*, 872 F. Supp. 1235 (S.D.N.Y. 1994). *Kraemer-Katz* (which is a district court decision, and so could not give rise to a circuit conflict in any event) did not address ownership of human tissues used for medical research. Instead, it involved terminating the administration of an investigational drug to a patient involved in a study of its possible use as a treatment for osteoporosis. The court noted that 45 C.F.R. § 46.116(b)(2) establishes requirements for notifying research participants of the anticipated circumstances in which the subject's participation may be terminated without regard to the subject's consent, and observed that a state law that prohibited termination even when federal regulatory requirements are met would be preempted. *Id.* at 1240. As in *Grimes*, the court was discussing a different issue, and there is no conflict with the decision in this case.

5. An additional consideration weighing against certiorari is the absence of a private right of action to pursue violations of the Common Rule. OHRP, the federal agency that enforces the Common

Rule, "is responsible for the oversight of compliance by [the University] and all other federally-funded institutions engaging in human-subject research studies." Pet. App. 27a. OHRP has broad powers to enforce the Common Rule, including authority to suspend research projects and recommend that institutions or investigators be debarred from all government-funded studies. HHS, OHRP, "OHRP's Compliance Oversight Procedures for Evaluating Institutions" 5-7 (Oct. 19, 2005), *available* at www.hhs.gov/ohrp/compliance/ohrpcomp.pdf.

Petitioners acknowledge that there is no private right of action for violation of the Common Rule. *See* Ward Pet. 9 n.2; *see also* Catalona C.A. Reply Br. 6, 23 ("[T]he Common Rule provides no private right of action."); *see Wright v. Fred Hutchinson Cancer Research Ctr.*, 269 F. Supp. 2d 1286, 1289 (W.D. Wash. 2002). In the court of appeals, Petitioners argued that the absence of a private right of action under the Common Rule is not fatal to their claims because they "are pressing state common law rights," not federal rights. Ward C.A. Reply Br. 12 n.6.

Petitioners' assertion that the absence of a private right of action under the Common Rule should not detract from their preemption argument misses a basic point: OHRP has ample authority to enforce its rules and to address any conflicts that it perceives between its regulations and state law. This Court should not grant review of a preemption question before the agency itself has expressed a view as to whether its regulations preempt state property law (and before any lower court has ruled on the agency's position).

II. The Decision Of The Court Of Appeals Is Correct.

Neither Petition challenges the panel's unanimous affirmance of an experienced district judge on an issue of Missouri state law. The courts below analyzed the elements of an *inter vivos* gift under Missouri law and held that there was a gift based on extensive evidence of donative intent, delivery, and acceptance of the blood and tissue samples. Pet. App. 11a-17a.

The court of appeals held that the evidence of an *inter vivos* gift was so extensive that it was unnecessary to rely on statements in some of the informed consent documents that the RP waived "any claim you might have to the body tissues you donate," and thus unnecessary to consider whether that language is "exculpatory" within the meaning of the Common Rule, 45 C.F.R. § 46.116. If the court of appeals had reached that question, however, it would likely have agreed with the district court that the language is permissible under the federal regulations. The ordinary meaning of the term "exculpatory" is "clearing or tending to clear from alleged fault or guilt." Black's Law Dictionary 608 (6th ed. 2004). This ordinary meaning is consistent with the regulation's express prohibition of "releases . . . from liability for negligence." 45 C.F.R. § 46.116.

Disregarding the ordinary meaning of "exculpatory," Petitioners take the position that federal regulations prohibit RPs from relinquishing *any* legal rights whatsoever in an informed consent document. This is absurd. The most basic right of an RP is not to participate in medical research. If RPs cannot relinquish this basic right by signing an

informed consent form, then medical research is impossible. Moreover, samples may be consumed in the course of research (and may be discarded, as some were by Dr. Catalona, if they are no longer useful for research). A right to repossess the samples on demand would call into question a fundamental assumption of research, that researchers may consume donated samples.

It is inconceivable that HHS, the federal agency that promulgated the Common Rule, intended to outlaw medical research using human tissues. If it intended such an extreme result, the agency would have announced its position directly rather than indirectly through a prohibition on "exculpatory language" in informed consents. In fact, OHRP has expressly stated that its "regulations are not intended to prohibit the informed subject from making a legitimate donation of his or her cells or future derivatives of those cells." University C.A. App. 6:1309-11 (Letter from F. William Dommel Jr., Director, Division of Compliance, Office for Protection from Research Risks [the predecessor of OHRP] to Merel F. Glauber, Office of General Counsel, University of California (Mar. 21, 1989).[5]

---

[5] OHRP's Acting Director recently sent a letter to the University's Vice Chancellor for Research "in order to assist Washington University and its institutional review board in its future consideration of research informed consent language." Letter from Ivor A. Pritchard to Samuel L. Stanley, Nov. 29, 2007. In the letter (which is reproduced as an appendix to this brief), "OHRP agrees with the district court that its guidance document on exculpatory language does not have a legally binding effect upon entities regulated by OHRP." App., *infra*, 4a. OHRP confirms that it conducted a compliance oversight (...continued)

Petitioners' reliance on the "exculpatory language" provision of the Common Rule fails for an additional reason as well. The Common Rule sets out the requirements for informed consent in federally-funded research involving human subjects. The Common Rule, including the exculpatory language prohibition, does not address ownership and confers no ownership rights on RPs. Instead, the exculpatory language prohibition addresses waivers of rights derived from some other source of law, such as state law. The OHRP guidance document Petitioners cite likewise refers to "property rights I *may* have . . . in tissue samples," without taking a position on whether RPs actually have such rights. As Petitioners' own expert acknowledged, a prohibition against disclaiming a right does not imply the existence of an underlying right.

---

investigation in 2000 and made no finding that the University's informed consent documents contain exculpatory language. The letter clarifies that, "except in jurisdictions in which it has been conclusively determined that all research subjects have no legal rights in their excised human biological material," when OHRP conducts compliance oversight investigations it will find language included in OHRP's guidance document that waives such rights to be exculpatory. *Id.* Accordingly, OHRP asks the University to "ensure that any such language is removed from consent documents currently used at Washington University." *Id.*

OHRP's letter does not take the position that the Common Rule preempts any state laws. To the contrary, it looks to state law as the possible source for individual legal rights in excised tissue. *Id.* Moreover, OHRP's letter demonstrates that it is fully capable of interpreting and enforcing its own regulations (and amending them if necessary). The letter thus provides further confirmation that review by this Court is not warranted.

University C.A. App. 1:189-90. For example, the exculpatory language provision precludes waivers of negligence claims, but does not create any such claims or divest the research institution of its defenses to such claims under state law. For a variety of reasons, including laws governing the disposal of medical waste, individuals generally cannot claim ownership rights in blood and tissue that has been removed from their bodies during medical procedures, even when the patient does not make an express donation. Individuals are safeguarded through laws protecting their privacy and requiring informed consent to medical research, not by giving them continued dominion and control of tissues under state property law.

In short, the Common Rule and state property law address distinct subjects, and thus do not conflict. The federal regulations deal with experimentation on human subjects, not ownership of tissue. Rather than preempting state property law, the Common Rule operates as a separate body of rules governing federally-funded research. In this respect, the Common Rule is like the federal environmental laws that impose restrictions on the use of real property but do not displace state property law.[6]

---

[6] Because there is no conflict between the Common Rule and state law, this case is unlike *Geier v. American Honda Motor Co.*, 529 U.S. 861 (2000), or *Hines v. Davidowitz*, 312 U.S. 52 (1941). In *Hillsborough County v. Automated Medical Laboratories, Inc.*, 471 U.S. 707 (1985), the Court held that regulations promulgated by the Food and Drug Administration did *not* preempt local laws regulating blood plasma centers. Here, as in *Hillsborough*, the federal agency has not indicated (...continued)

III. The Court Of Appeals' Decision Will Not Have Adverse Consequences.

There is no factual or legal basis for Petitioners' assertion that the court of appeals' decision will have adverse consequences for RPs and medical research. The decision in this case does not change preexisting law, which provides multiple layers of protection for RPs. As explained in the amicus briefs filed in the court of appeals by the American Cancer Society, the Association of American Medical Colleges, the Mayo Clinic, and others, it is the position advocated by Petitioners that would cause profound damage to medical research, by making it difficult or impossible for researchers to share samples, and by making biorepositories vulnerable to attack by for-profit entities.

1. For good reason, Petitioners have largely abandoned the argument, made in their unsuccessful stay application to this Court, that all samples in the biorepository must be preserved for possible clinical use by RPs and their families. That argument ignored the fundamental requirement that investigators draw a bright line between medical research and clinical treatment, to ensure that RPs do not erroneously believe their participation in research will affect their clinical care. *See e.g.*, Carl H. Coleman, *Duties To Subjects In Clinical Research*,

---

that its regulations are intended to be exclusive, or conflict with state law.

58 Vand. L. Rev. 387 (2005).[7] Consistent with this requirement, no RP testified that he expected to receive any clinical benefit from his participation in these studies. To the contrary, the district court found that the University's brochures and informed consent documents specifically informed RPs that they would *not* receive any direct benefit from their participation Pet. App. 25a; University C.A. App. 3:677; 4:931. Moreover, the RPs were informed that samples could be consumed during research, and they thus had no expectation that the samples would be preserved for clinical purposes.

In fact, the record demonstrates that samples in the biorepository are highly unlikely to be of clinical benefit to RPs or their families. Dr. Catalona could recall only a single instance in his decades at the University in which any of the tens of thousands of tissue samples in the biorepository was requested for a clinical purpose. University C.A. App. 2:237-39. Dr. Andriole, Dr. Catalona's successor as Chief of the University's Division of Urology, could not recall *any* such instance during his 19-year tenure. *Id.* at 2:362.[8]

---

[7] The purpose of therapeutic practice is to provide treatment to individuals. By contrast, research is intended to contribute to generalizable knowledge. *See* National Commission for the Protection of Human Subjects of Biomedical and Behavioral Research. *The Belmont Report: Ethical Principles and Guidelines for the Protection of Human Subjects of Research*, Part A: Boundaries Between Practice and Research (April 18, 1979), *available at* http://www.hhs.gov/ohrp/humansubjects/guidance/belmont.htm.

[8] Petitioners have sought to rely on Dr. Andriole's testimony for the proposition that samples in the biorepository were (...continued)

2. There is also no basis for the assertion that, as a result of the court of appeals' decision, tissue samples in the biorepository may now be used for "embryonic stem cell research," "research on genetic cloning," or other research that RPs oppose on religious or moral grounds. Br. of Amicus Curiae Us Too, Int'l 9-10; *see also* Catalona Pet. 13; Ward Pet. 14 (University "may do whatever it pleases with [the samples] regardless of what it has previously told participants about its purposes"). Petitioners' informed consents stated that the samples could be used for research connected to prostate cancer. There is no prospect (and certainly no evidence) that the University would seek to use samples in the biorepository for any other type of research (or that the samples would even be useful for research that is not related to prostate cancer). If the University ever proposed to do that, the Common Rule would require it to submit any new research protocol to the IRB for approval. The IRB could deny the proposal and could require the University to seek new informed consents from the RPs if a proposal were approved. 45 C.F.R. § 46.109.

Similarly unsupported is Petitioners' assertion that, as a result of the court of appeals' decision, the University will "not hesitate to use research participants' tissues for profit." Catalona Pet. 10. The University has never sold samples from the biorepository for profit; to the contrary, it has

---

important for their clinical care, but that testimony referred to the general medical advances that are the object of all medical research, not a specific clinical benefit for the RP Petitioners.

expended millions of dollars to establish and maintain the biorepository as a resource for basic medical research.[9] It is *Petitioners'* position that would encourage bidding wars in which for-profit ventures sought to obtain samples from non-profit biorepositories dedicated to basic medical research. *See* Pet. App. 52a.[10]

3. The court of appeals' decision does not free the University to release the RPs' personal data. Petitioners fail to acknowledge that the RPs' personal data is independently protected by existing laws and regulations. For example, the informed consent documents provide: "I understand that the investigator(s) and the University will take all reasonable measures to protect the confidentiality of my records and my identity will not be revealed in any publication that may result from this project. The confidentiality of my records will be maintained in accordance with applicable state and federal laws." University C.A. App. 3:673. The court of

---

[9] Petitioners cite testimony allegedly showing that the University plans to sell samples to the highest bidder, but that testimony shows only that some University officials were concerned that Dr. Catalona seemed willing to deplete the biorepository in return for being listed as a co-author of a publication. Catalona Pet. 11, citing Catalona C.A. App. 157:33.

[10] If Dr. Catalona were to gain control of the samples he could do the very things Petitioners profess to fear the University might do. In the past, Dr. Catalona destroyed samples without the consent of the RPs, transferred samples to other research institutions without RPs' consent, and advocated that RPs be required to waive ownership claims. University C.A. App. 1:87-89, 104-05; 2:241-46, 248-49, 258-60; 3:554, 575, 583, 598, 601, 612, 616.

appeals' decision concerning ownership of the samples does not change the high degree of legal protection afforded to the RPs' personal data.[11]

Petitioners assert that "individuals will be far less likely to consent in the first place" to providing blood and tissue samples for medical research "if they are asked to give up all ownership and control of their own tissues, without any way of knowing how their cells, blood, and DNA will be used." Ward Pet. 15. The decision in this case agrees with every prior judicial decision on point, and there is no indication that these prior decisions have caused individuals to refuse to participate in medical research. Moreover, the RPs in this case *were* told how the samples will be used (for research by University physicians and other researchers related to prostate cancer), and thousands agreed to participate even though they were plainly informed that in doing so they were waiving any claim they might have to the tissues they donated. A comprehensive regulatory system, including provisions for IRB and OHRP oversight, ensures that

---

[11] Although Petitioners refuse to acknowledge that "de-identifying" tissue samples (by separating them from the donor's identifying information) is relevant or even possible, de-identification is a basic concept recognized by the Common Rule. *See* 45 C.F.R. §§ 46.101(b)(4), 46.102(f). We leave behind some of our hair, containing our DNA, every time we visit the barber, but no one can link it to us without a reference sample. The same is true of research specimens. They cannot be linked to the donor without access to the donor's genotype as well as the specimen genotype. Accordingly, there is no scientific basis, as well as no legal basis, for the Petitioners' suggestion that the University's ownership of the tissue samples will inevitably lead to a misuse of personal information.

researchers adhere to the limitations set forth in informed consent documents and protect RPs' privacy and personal data.

4. Petitioners' amicus is incorrect in asserting (Us Too Br. 12) that Petitioners contributed samples to be used solely by Dr. Catalona. The informed consent forms and brochures specifically stated that the samples could be used for prostate cancer research conducted by other Washington University physicians as well as for "research with our collaborators at . . . other institutions." University C.A. App. 3:653, 664, 673, 675, 677, 679, 685, 779.

Moreover, the University has informed Dr. Catalona that he is free to request samples from the biorepository and that any such request will be considered on its merits. *Id.* at 2:326-27. The University's Peer Review Panel has granted all three requests for samples submitted by Dr. Catalona. *Id.* at 2:324-25. Thus, there is no reason to conclude that samples in the biorepository will not continue to be available to Dr. Catalona for research related to prostate cancer.

5. Finally, it is undisputed that the "Medical Consent & Authorization" forms requesting that samples be transferred from the biorepository to Dr. Catalona were themselves distributed in violation of the Common Rule. Expert witnesses for *both* sides, and even Petitioner Catalona himself, all agreed that the "Medical Consent & Authorization" was not a valid informed consent document. *Id.* at 1:58, 73, 177-78, 200-01; 2:231-32, 396-97, 450-457. The district court found that the context in which the form was sent is "troubling" and "smacks of undue influence." *See* Pet. App. 51a-52a.

CONCLUSION

The petitions for a writ of certiorari should be denied.

Respectfully submitted,

APPENDIX

Department of Health & Human Services

Office of the Secretary
Office of Public Health and Science
Office for Human Research Protections
Rockville, Maryland 20852

Nov 29, 2007

Samuel L. Stanley, Jr., M.D.
Vice Chancellor for Research
Washington University School of Medicine
660 South Euclid, Box 8027
St. Louis, MO 63110

Dear Dr. Stanley:

The Office for Human Research Protections (OHRP) has read with interest the district court's opinion in the case of *Washington University v. Catalona, et.al.*, 437 F. Supp. 2d 985 (E.D. Miss. 2006), and the appellate court's opinion affirming the district court's conclusions in *Washington University v. Catalona, et.al.*, 490 F.3d 667 (8th Cir. 2007). In particular, OHRP has noted the courts' statements regarding OHRP's guidance on what language is "exculpatory" under the HHS protection of human subjects regulations, 45 CFR part 46, and thus is regulatorily prohibited from inclusion in a research informed consent document. 45 C.F.R. § 46.116. In order to assist Washington University and its

institutional review board in its future consideration of research informed consent language, I write to clarify OHRP's position as to what language is considered "exculpatory."

OHRP notes that the *Catalona* district court addresses exculpatory language, and OHRP's interpretation of what language qualifies as exculpatory, at several points in its opinion. When presented with OHRP's November 15, 1996 guidance document "'Exculpatory Language' in Informed Consent," which gives examples of language that OHRP considers to be exculpatory, the district court stated that the OHRP guidance is not legally binding upon Washington University, and merely presents an opinion by OHRP regarding what language would be considered exculpatory and thus in violation of the HHS protection of human subjects regulations. *Catalona*, 437 F. Supp. 2d at 998. The district court further stated that the research community's opinion as to what language is "exculpatory" may differ from OHRP's position:

> The governing federal regulation (as to informed consent), 45 C.F.R. § 46.116, only prohibits exculpatory language in the form of a waiver or release from liability.
>
> > "No informed consent, whether oral or written, may include any exculpatory language through which the subject or the representative is made to waive any of the subject's legal rights, or releases or appears to release the investigator, the sponsor, the institution or its agents from liability for negligence."

> It is clear that the only legal obligation WU had was not to include exculpatory language in its informed consent forms which waived any legal rights the RP may have or relieve any party from liability for negligence. Hearing testimony from all experts indicated that the research community consistently understood 45 C.F.R. § 46.116 to bar exculpatory language involving releases from malpractice or other negligence. The OPRR's opinion as to exculpatory language does not govern the informed consents and therefore, does not affect the ownership interest of WU in the materials stored in the GU Biorepository.

Catalona, 437 F. Supp. 2d at 998 (substitution of OHRP for OPRR added). The district court also stated that "as of the date(s) of the hearing, no regulatory agency, including the OHRP, has taken any action against WU regarding the informed consent forms used . . . " *Catalona*, 437 F. Supp. 2d at 992.

OHRP further notes that on appeal, the U.S. Court of Appeals for the 8th Circuit included the following footnote in its opinion affirming the district court's decision, which addresses the informed consent language that Dr. Catalona asserted was exculpatory:

> Because the specific language contained in the consent forms and brochures, as well as the circumstances surrounding the RPs' voluntary decision to donate their biological materials,

> convinces us the RPs intended to make inter vivos gifts of their materials, we find it unnecessary to address the effect or validity of the consent forms' waiver language ("By agreeing to participate in this study, you agree to waive any claim you might have to the body tissues that you donate.")

Catalona, 2007 U.S. App. LEXIS 14442, **22.

OHRP agrees with the district court that its guidance document on exculpatory language does not have a legally binding effect upon entities regulated by OHRP. OHRP wishes to clarify that, the district court's opinion notwithstanding, the language included in OHRP's guidance document that is labeled "exculpatory" would be found as such by OHRP during the course of a compliance oversight investigation.

In reference to the district court's statement that to date, OHRP has taken no action against Washington University in reference to the informed consent forms used by the university, OHRP wishes to clarify any possible misconception regarding this point. OHRP notes that in a compliance oversighted investigation that OHRP conducted with Washington University in 2000, OHRP reviewed an informed consent document template that included the following language:

> . . . nor can you claim ownership rights to any medical or scientific product that results from research with your tissue. . . . You will receive no monetary payment nor can you claim ownership rights to any medical or

scientific product that results from research with your tissue. . . .

OHRP did not make a finding of noncompliance regarding this particular language. However, please note that OHRP's failure to make a finding of noncompliance regarding this informed consent language is not an indication that OHRP found this language to be in compliance with the HHS protection of human subjects regulations.

OHRP recognizes the possibility that individuals may have certain legal rights in their excised tissue or other human biological materials, even in the absence of a specific recognition or an affirmative establishment of any such legal rights in these materials by the relevant legal body of a particular jurisdiction. Therefore, except in jurisdictions in which it has been conclusively determined that all research subjects have no legal rights in their excised human biological material, OHRP continues to find language that waives any such legal rights on the part of research subjects to be exculpatory. We believe that, to date, no jurisdictions have conclusively determined that all human subjects have no legal rights in their excised biological material that is used for research purposes.

Please ensure that any such language is removed from informed consent documents currently used at Washington University for human subjects research conducted under the University's Federalwide Assurance with OHRP. If you would like to discuss this issue further, feel free to contact OHRP. Thank you for your commitment to protecting human research subjects.

Sincerely,

/s/

REGULATION

46 C.F.R. § 46.116 1

I
INTRODUCTION

The Research Participants' petition for certiorari explained that the Eighth Circuit improperly ignored the Common Rule – federal regulations intended to protect patients' rights in dealing with federally funded research institutions – in holding that Washington University (the "University") had become the owner of Petitioners' tissue samples. The University now claims that review is unwarranted because the Court of Appeals declined to address the meaning of the pertinent federal regulation. Br. in Opp. at 14-15. Yet the Eighth Circuit's failure even to acknowledge a dispositive federal issue is a reason that certiorari *should* be granted. This Court should make clear that a lower court cannot shield a litigated federal issue from review just by declining to consider it. The Court of Appeals' reversible error was not just in misapplying a dispositive federal regulation but in ignoring its existence and, in the process, the role of the federal government in protecting individual rights and the integrity of medical research.

Indeed, the University's brief in opposition now confirms that Petitioners' interpretation of the regulation is correct. The Common Rule prohibits federally funded research institutions from seeking consent from participants using "exculpatory language through which the subject ... is made to waive or appear to waive any of the subject's legal rights." 46 C.F.R. § 46.116. The University's Brief includes a November 2007 letter to the University from the Office of Human Research Protection ("OHRP"), the agency in charge of enforcing the

Common Rule, which states that OHRP finds language that "waives *any* such legal rights on the part of research subjects to be exculpatory." Br. in Opp. 5a (emphasis added). Had the Eighth Circuit adopted this correct interpretation, it could not have ruled that Petitioners had waived their ownership rights in their tissue and blood – a ruling that eviscerates the federal rights guaranteed to research participants and renders meaningless the Common Rule's prohibition of exculpatory language.

Faced with an agency interpretation supporting Petitioners, the University makes several specious arguments against granting certiorari. Contrary to the University's arguments, the petition does present a federal question that was fully litigated below. Moreover, the resolution of that federal question not only would be outcome-determinative here, but also would have a significant impact on the way that research is conducted around the country.

For these reasons, which are discussed in detail below, Petitioners ask that the Court grant the petition, or, in the alternative, seek the views of the Solicitor General concerning the meaning of the Common Rule and the advisability of granting review in this case.

ARGUMENT IN REPLY

1. The University's brief in opposition begins with a series of fallacious arguments advanced in an effort to show that the federal question presented by Petitioners is not properly before the Court. Those arguments are easily rebutted. The University's primary argument is that review is unwarranted

because the Eighth Circuit (although not the District Court) failed to consider the meaning of the federal regulation. But an appellate court may not shield a dispositive litigated federal issue from review simply by ignoring it – especially where, as here, its decision is likely to be viewed by other courts as having resolved that issue.

In an attempt to excuse the Eighth Circuit's failure to discuss the effect of the Common Rule, the University claims that Petitioners did not raise the federal preemption defense to the University's state-law claim of ownership of the tissue samples. Br. in Opp. at 13-17. That is flatly untrue. Although Petitioners also argued that they should prevail as a matter of state law, they quite expressly argued that the Common Rule barred a contrary interpretation of state law as permitting the transfer of title to the samples. Petitioners made this argument both in the trial court – which did address, albeit incorrectly, the meaning of the regulation – and in the appellate court. RP Br. at 11 (E.D. Mo. filed June 15, 2005); RP Br. at 29-33 (8th Cir. filed July 12, 2006); RP Reply Br. at 20 (8th Cir. filed Sept. 21, 2006) ("[T]he Common Rule's prohibition on exculpatory language, 45 C.F.R. § 46.116, bars waiver of the RPs' ownership rights in the samples provided for research."); *see also* RP Pet. at 9. Indeed, while the University now asserts the preemption issue was not presented, it devoted several pages of its own responsive appellate brief to the effect of the Common Rule. WU Br. at 40-43 (8th Cir. filed Aug. 25, 2006).

Even less plausible is the University's argument that the meaning of the Common Rule is not dispositive in this case. Br. in Opp. at 16-17. Petitioners' argument is that the Common Rule bars research participants from consenting to the surrender of the ownership of their tissue. The lower courts found that Petitioners *had* in fact donated their tissues, a result that is incompatible with Petitioners' interpretation of the regulation. The University seems to suggest that the preemption would only affect some of the language in the informed-consent forms given to Petitioners, arguing that the Eighth Circuit correctly found that other language, combined with various other circumstances, sufficed to establish donative intent. But that misses the point. The Common Rule bars the University from even asking for a transfer of ownership and preempts *any* language in the forms that might effect such a transfer – even if that language does not expressly address the issue of ownership. The Court of Appeals had no plausible basis for ignoring this fundamental problem with its analysis.

2. The University also now tries to defend the outcome below as being "correct." Br. in Opp. at 22. But the University attached a letter it received from OHRP showing precisely the opposite. That letter makes plain – contrary to the University's position – that the regulation's prohibition on "exculpatory" language does not bar only waivers of negligence claims. Instead, OHRP interprets the regulation to bar the waiver of *any* legal right the research

participant has under state law, including ownership of tissue samples.

> [E]xcept in jurisdictions in which it has been conclusively determined that all research subjects have no legal rights in their excised human biological material, *OHRP continues to find language that waives any such legal rights on the part of research subjects to be exculpatory.* We believe that, to date, no jurisdictions have conclusively determined that all human subjects have no legal rights in their excised biological material that is used for research purposes.

Br. in Opp. at 5a (emphasis added).

The Eighth Circuit held that in light of the "language contained in the consent forms and brochures" that spoke of "donation," Pet. App. at 13a, 16a & n.7, Petitioners surrendered their ownership rights in their tissue. But that is precisely what the federal regulation, and OHRP's interpretation of the exculpatory language clause, prohibit. The tissues unquestionably belonged to Petitioners unless they validly consented to waiver of their ownership rights. And under the Common Rule, they could not make such a waiver.[1]

---

[1] Thus, whatever OHRP's position might have been several decades ago, *see* Br. in Opp. at 23 (citing 1989 letter), it is plain that under OHRP's current view the federal regulations do, in fact, prohibit outright donation of tissues for research: federal law guarantees a continuing right to withdraw from research,

The University entirely ignores the fact that the OHRP letter supports *Petitioners'* interpretation. Instead, it adverts to dictionary definitions in attempt to bolster its own contrary view. Br. in Opp. at 22. But OHRP's interpretation is controlling under hornbook principles of administrative law, so long as it is not "plainly erroneous," which it is not. *Long Island Care at Home, Ltd. v. Coke*, 127 S. Ct. 2339, 2349 (2007).

The University's invocation of the *Moore* and *Greenberg* cases, Br. in Opp. at 18-20, is particularly inapposite. Neither of those cases involved an interpretation of the Common Rule because neither involved donation of tissue for federally funded research covered by the Common Rule. Nor did either case involve interpretation of a written informed-consent document. Indeed, *Moore* specifically held that research participants could look to the protections of written informed consent, the very protections that the Common Rule enforces. *Moore v. Regents of Univ. of Cal.*, 793 P.2d 479, 494 (Cal. 1990).

Perhaps tacitly recognizing that the OHRP letter supports Petitioners on the critical question whether the Common Rule permitted the University even to ask for tissue donations (as opposed to the right to *use* tissues subject to the RPs' right to withdraw consent later), the University argues in the alternative that the regulation is not enforceable. The University begins with the red herring that the

---

and the informed consent document cannot contain any language suggesting that the patient waived a right.

Common Rule does not create a private right of action. Br. in Opp. at 21. Yet as Petitioners have explained, they did not bring an action under the Common Rule; rather, they are seeking the protection of the Rule against the University's claim of ownership, brought by the University in a declaratory judgment action. Pet. at 9 n.2. Likewise, OHRP's letter does not bar Petitioners from invoking the Rule. The letter states that it "agrees with the district court that its guidance document on exculpatory language does not have a legally binding effect upon entities regulated by OHRP." Br. in Opp. at 4a. But Petitioners are not seeking to enforce the guidance document; they are seeking to enforce the regulation. Moreover, the district court did not hold that the guidance document "does not have a legally binding effect." It held that the guidance document was legally binding as to waivers of negligence claims. Pet. App. at 47a. In light of what is, at a minimum, the ambiguity of OHRP's interpretation on this point, this Court should at least call for the views of the Solicitor General as to the proper interpretation of the regulation.

3. Finally, contrary to the University's protestations, and consistent with the enormous public interest in this case, Pet. at 13 n.3, the issue presented here is one of great importance. The University downplays the negative consequences of the lower courts' ownership ruling, claiming that the University can be trusted not to abuse its ownership rights or that other legal provisions prevent misuse. But these arguments are unavailing.

First, the University invokes the Common Rule itself as a limitation on its ability to use the samples for controversial research that lies beyond the scope of the original protocol approved by the patient. Br. in Opp. at 28. Yet it has been the University's position throughout the litigation that once it deidentifies the tissue samples, they are no longer protected by the Common Rule. Pet. at 15, 18-19. Indeed, the Brief in Opposition contains a lengthy footnote reserving the University's right to deidentify the samples. Br. in Opp. at 30 n.11. By the University's own account, the Common Rule is no bar to misuse of the tissues.

Second, the University protests that it can be trusted not to cash in on its ownership rights. Leaving aside the evidence in the record that suggests otherwise, Pet. at 14, the Eighth Circuit's ruling covers far more institutions than just the University. In the face of the Eighth Circuit's bestowal of property rights, under state law and notwithstanding the federal regulation, other institutions may use samples for monetary gain. And, in a world where information contained in fresh frozen tumor samples does (and in the future increasingly will) affect treatment choices, selling off samples will harm the research participants and their families.

Third, and relatedly, the Eighth Circuit's decision will dramatically change the way research samples are used and will have a profound effect on the willingness of individuals to participate in research in the first place. The Common Rule exists to safeguard informed consent in the sensitive and

morally complicated area of human subject research. Under the Eighth Circuit's rule, individuals – people just like Petitioners – can be held to have waived all say in the future use of their tissues, despite the Common Rule's express regulation to the contrary. That decision is worthy of this Court's review in order to ensure that the protections provided by federal law are more than paper rights.

CONCLUSION

For all of these reasons, as well as those set forth in the opening petition, Petitioners ask that the Court grant review in this case.

Respectfully submitted,

PAUL M. SMITH

INTRODUCTION

INTEREST OF AMICUS

Amicus Curiae Us TOO International respectfully submits this brief under Rule 37.[1]

Us TOO International is a prostate cancer support organization founded in 1990 by prostate cancer survivors to serve prostate cancer patients and their families. ***Us TOO International*** is a network of 325 support groups located in the United States (U.S.) and 10 countries made up of thousands of prostate cancer health care professionals, patients, survivors and their family members who work as volunteers to share education, information and support in the battle against prostate cancer. ***Us TOO International*** is the only prostate cancer organization whose exclusive mission is to be the voice of patients. Other organizations, like the American Cancer Society, represent patients in some settings, but have conflicts of interest about representing patients in this case since they conduct research and run biorepositories.

Us TOO International is a 501(c)(3) not-for-profit charitable organization dedicated to communicating timely and reliable information

---

[1] No counsel for a party authored this brief in whole or in part; no person other than amicus or its members made a monetary contribution intended to fund the preparation or submission of this brief. Timely notice of intent to file this brief was given to all parties, and all parties provided written consent to the filing of this brief.

enabling informed choices regarding detection and treatment of prostate cancer. It also provides information about the potential risks and benefits of participating in clinical research. ***Us TOO International*** is committed to enhancing the quality of life for all people affected by prostate cancer.

The primary mission of the ***Us TOO International*** advocacy effort is to identify, enlist and support a national team of prostate cancer volunteer advocates from the core of men with prostate cancer, their friends and loved ones and concerned others, including physicians and scientists to carry out the mission of the organization. Our members have participated in the studies at Washington University and in other research studies. The effects of this case - including the 8th Circuit's abrogation of the federal protections designed to protect patients who participate in research - are devastating to participants and to research, and it is of vital importance to the research participants that the law should be correctly applied.

The goal of prostate cancer research is to eliminate or reduce suffering and death from prostate cancer. While there is evidence that participating in prostate cancer research can save lives, there will be no research without the participation of the people who provide their time and literally themselves.

A prime example of research that was made possible through the voluntary participation of men like Petitioners Ward, McGurk, Garcia, Castro, Parron, Wiland, Ellis, and Missios is the early

detection of prostate cancer through testing of blood samples for prostate specific antigen (PSA). This research was pioneered by Dr. Catalona beginning in 1991. Since this time, there has been more than a 75% reduction in the proportion of patients who have advanced metastatic disease at the time of prostate cancer diagnosis in the U.S. through 2003, and a 32.5% reduction in the age-adjusted prostate cancer mortality rate according to the National Cancer Institute (website: http://www.seer.cancer.gov/statfacts/html/prost.html ?statfacts_page=prost.html&x=10&y=14).

A study examining the relation of PSA screening to the stage of cancer at diagnosis and prostate cancer death rates in 30 population-based U.S. cancer registries revealed that the more prevalent the PSA testing in a region of the U.S., the less advanced-stage disease is diagnosed and the lower the prostate cancer death rate (Jemal A et al, Cancer Epidemiol Biomarkers Prev 2005;14:590). This research would not have been possible without men who had been diagnosed with prostate cancer, and their families, voluntarily agreeing to participate in prostate cancer research studies.

The progress made in prostate cancer research in the future will be in genetics. New advances in genetics have lead to the now-frequently used term, "Personalized Medicine," referring to the treatment of cancer and other diseases depending to some extent on the patient's personal DNA (reviewed extensively in May of 2006 in the journal *Science* (*Frontiers in Cancer Research*, Special Content, 312 *SCIENCE* 1162-1178 (May 26, 2006)). Because this

kind of research will determine future directions for cancer care, ***Us TOO International*** has a highly vested interest in preserving patient trust and confidence in the research community in this country. As will be shown below, most adults in the U.S. do not believe current law and organizational policies provide them enough privacy protection in medical research.

Accordingly, the voice of ***Us TOO International*** is important in this compelling landmark case, which has been wrongly decided in the courts below. This case is a critical test, because unless these protections are accorded every patient and research participant, people will become unwilling to volunteer for research.

Us TOO International submits this brief as *amicus curiae* for the purpose of bringing new matters to the Court to assist it in making its decision concerning the petitions for writ of certiorari on this issue of great national importance.

SUMMARY OF ARGUMENT

The first inviolable principle of human research is that participation must be voluntary and consent must be informed. People have the right to choose, or to decline, to participate in research. And people have strong feelings – ethical, moral, religious - about the types of research they are willing to participate in. The federal regulations codify participant's rights in research by reiterating that consent must be voluntary and informed and that participants have the right to discontinue

participation at any time for any reason. 45 C.F.R. §§ 46.116, 46.116(a) (8).

The lower court's finding, and Washington University's argument that it can continue to perform research on the tissue of a person who has withdrawn from research merely by taking the person's name off the sample is preposterous. Continuing research on the tissue violates a person's right to not be researched upon without their consent. Stripping a person's name off a tissue sample does not change the unique genetic makeup of the sample that could only have come from that one person.

STATEMENT OF FACTS

Petitioners are William J. Catalona, M.D. of Illinois, and Richard N. Ward of Kansas, Thomas A. McGurk of Indiana, Luis Garcia, Antonio Castro, and Ivan Parron of Florida, Philip Wiland of Colorado, James D. Ellis of Texas, and Mike Missios of Alabama. All patient petitioners are former patients of Dr. Catalona.

Dr. Catalona, a preeminent prostate cancer surgeon and researcher, played a leading role in the development of a large tissue bank while he was employed at Washington University. The patients who are petitioners in this suit, all non residents of State of Missouri, enrolled in research protocols designed by Dr. Catalona while he was an employee of Washington University, and all provided tissue as part of their participation in his research protocols. They, along with the 6,000 other people who wrote

Washington University, are unanimous in their desire for Dr. Catalona, not Washington University, to conduct further prostate cancer research on their tissue – as they were initially promised.

These patients each had their cancerous prostate gland removed by Dr. Catalona and consented to participate in research allowing testing to be performed upon their retained prostate tissue and blood samples by Dr. Catalona and his collaborators. Each participant typically was asked to sign both a consent form and an informational brochure that Washington University had provided, frequently right before surgery was performed. While some of the consent forms referred to the provision of samples as a "donation," they also promised the research participant that he could discontinue participation or withdraw consent at any time. The informational brochure provided to participants stated that a research participant could change his mind and ask that his samples no longer be used in research or even be destroyed.

The consent forms also provided information about the risks the patients and their families faced by participating in genetics research, such as the risk of discrimination in insurance and employment if insurers or employers were to find out information revealed in the study. Because of these risks, it is of vital importance that the research participants maintain continued control over what is done with their tissue and that the University be forced to follow rules governing the participation of human research subjects, as well as the express promises made to the participants.

Currently, the personal identities and protected health information are linked to the samples the participants provided in electronic research databases. Not only is this the most valuable method for research purposes, it also creates the most risk for the participants that their confidential information will be disclosed.

Early in 2003, the participants requested in writing that Washington University transfer their tissues to Dr. Catalona, now at Northwestern University, for continuation of the prostate cancer research they desired to be performed. They are among 6,000 other patients and research participants who sent written requests to Washington University seeking to have Dr. Catalona have custody of their samples for purposes of continuing the research that they originally intended and for which they consented. Washington University did not inform the research participants who provided their tissue to be used in research studies that their tissue was now the subject of a lawsuit and in fact objected to the research participants' motion to intervene in the case. Because the University and its ***amici*** do not speak in the patients' interest, the voice of ***Us TOO International*** is crucial to this case.

The federal district court's and the subsequent 8th Circuit Court of Appeals' decisions failed to consider the proper impact that federal regulations and the Common Rule have upon the Missouri state law under consideration. This failure to accede to the power of the higher federal authority violates the

established principle that the Supremacy Clause invalidates state laws that obstruct federal law. U.S. Const. art. VI, cl. 2, *Hillsborough County v Automated Med. Labs, Inc*, 471 U.S. 707,712,713 (1985). See *Geier v. American Honda Motor Co.*, 529 U.S. 861, 884 (2000); *Long Island Care at Home, Ltd. V. Coke*, 127 S. Ct. 2339, 2349 (2007). It is of vital importance to the integrity of the U.S. research enterprise that this sidestepping of the federal issue by these lower courts be addressed by the Supreme Court.

The Judgment in this case makes no distinction between human subjects' bodily tissues and fungible goods. The tissues and blood involved here are not fungible goods[2]. Each is linked to the research subject, and is identifiable and unique. The district court, affirmed by the 8th Circuit, held that Washington University owns the human tissue, including Petitioners' tissue, held in the biorepository. Such a decision ignores the controlling federal regulations and is based upon language that is not permitted by federal regulations.

---

[2] The University has argued that the patients providing the tissue is like them giving money to a charity, where they cannot direct how it is used after the charity receives it. This exemplifies how little respect the University has for the patients' tissue and their private genetic information contained therein. While money has no memory, the patients' tissue contains highly personal information about them, their ancestors, and their descendents.

ARGUMENT

Patient and research participant rights and protections are a significant and pervasive issue of concern among the American public that has not been fully addressed by either of the petitions before this Court, and there are compelling reasons for the Court to grant full review.

The courts' decisions below show confusion and a misunderstanding of the research enterprise in this country. Human research is a multi-billion dollar industry in this country. But unlike other industries, it relies on people and their body parts for the raw material. People altruistically provide their tissue to be used in studies that are important to them. They are protected by the principle that research cannot be conducted upon them without their consent. Their right to informed consent also means that they have the right to choose which research studies they participate in. Research participants have inviolable rights to choose what research they are willing to allow on themselves and their tissue and to withdraw from research at any time for any reason (or for no reason at all). 45 C.F.R. § 46.116 (regarding informed consent); 45 C.F.R. § 46.116(a)(8) (regarding right to discontinue participation in research). These principles have been abrogated by the lower courts' decisions.

The purpose of the federal regulations known as the "Common Rule" is to protect people from abuse. People have strong feelings about what types of research should be done on them. Some individuals have religious beliefs about what

research should be done; for example, some people oppose embryonic stem cell research and would not want their tissue used in that research. In a study published in 2004, researchers found that 82% of survey respondents would be willing to donate tissue samples for cancer research; 65% would be willing to donate tissue samples for research on genetic disorders; 59% would be willing to donate tissue samples for research on general knowledge of tissues or for testing different medicines; and only 26% would be willing to donate tissue samples for research on genetic cloning.[3] In the same study, 42% of respondents wanted to be informed if their tissues were to be stored beyond the time required for diagnosis, and 35% wanted to be consulted if additional research was to be undertaken on stored tissue in the future.[4]

The evidence that people do care about the type of research they participate in, who performs the research, and what is done with their information is further buttressed by a recent study conducted by a prestigious non-profit organization, the Institute of Medicine (IOM). (www.iom.edu). In 2007, the IOM commissioned Harris Interactive, one of the most respected independent opinion polling services in the U.S., to conduct a poll to determine, among other things, how the public views the overall health privacy scene. More specifically, they set out to learn: (1) what kind of notice and consent the

---

[3] Michael L. Goodson, B.G. Vernon, "A Study of Public Opinion on the Use of Tissue Samples from Living Subjects for Clinical Research," 57 Journal of Clinical Pathology 135-138, 137 (2004).

[4] *Id.* at 136.

public wants before their personal medical and health information is used in a study, and (2) what kind of privacy harms worry those who want to have express notice and consent before their private information is used in health research. Of people who have been asked to have their personal medical information used in research and decided *not* to participate, 30% were concerned that their personal medical information would not be kept private or confidential, while 22% did not have trust in people or organization that conduct the research. Practically none (1%) said that researchers would be free to use their personal medical information without their consent. No more than 19% said their consent would not be needed as long as their information was "de-identified." Thirty-eight percent of people would want each research study seeking to use their personal medical information to first get their specific consent.

The Harris poll and other studies plainly show how important it is that current regulations be enforced. As this case now stands, in the aftermath of the lower courts' rulings, after an institution has taken possession of the sample, ***no consent*** would be required for a research institution to conduct other unsanctioned research with it. This flies in the face of the first inalienable principle of human subject research that consent must be informed and voluntary. By ignoring the explicit language of the informed consent documents and the federal regulations, the court has created a precedent that regardless of what is promised to induce people to participate, the institution can later claim ownership of people's tissue. Regardless of what the consent

form said, the bottom line would be that the research institution (in this case Washington University) would own the samples.

Awarding Washington University ownership of the research participants' tissue forces them to participate in research without their consent. The research participants chose to participate in research to benefit themselves, their families, and society. They decided that the best way to accomplish this was to provide their tissue to be used by Dr. Catalona in his research studies. They do not want their tissue used by Washington University, even if their name is taken off the sample, which the university claims will "anonymize" it.

Anonymization of the research participants' samples at Washington University's discretion was an option created *post hoc* to allow it to continue research after a participant withdrew from research.[5] Incredibly, the district court adopted this argument and held that if the participants withdrew, Washington University, at its sole discretion, could remove all personal identifying information from the samples and use them for other research projects not approved by the participants. However, because of current technologies, it is never possible to truly anonymize a person's genetic sample and the possibility of a person being identified through their tissue is becoming a concern for researchers worried about the privacy of people who participate in research protocols. This concern

---

[5] Plaintiff's Post-Hearing Reply Brief at 5.

is magnified as data and samples are increasingly shared and the federal government has begun mandating online posting of research data and results. (See Amy L. McGuire and Richard A. Gibbs, "No Longer De-Identified," 312 Science 370-71 (2006); Zhen Lin, Art Owen, and Russ Altman, "Genomic Research and Human Subject Privacy," 305 Science 183 (2004).) This year, a child was able to track down his anonymous biological sperm donor father by using his own DNA and online genetic genealogy resources. (Alison Motluk, *Anonymous Sperm Donor Traced on Internet*, Newscientist.com, November 3, 2005, http://www.newscientist.com/article.ns?id=mg18825244.200) Clearly a person's DNA cannot be "anonymized."

In any event, even attempted anonymization or de-identification goes against the research participants' intent, and diminishes the value of the tissue for research and the possible future benefit for the patient and his family. When the person's identity is linked to the sample, the person can be contacted for further information about his health. His samples can be linked to those of his relatives to try to identify genetic mutations that lead to particular diseases. Destroying the code linking the subject's name and relating information from the database would preclude or impede the research participant and his children from personally benefiting from the research. This negates one of the few benefits to the research participant noted in the informed consent documents, the idea that the research could specifically benefit the participant

and his family, including warning them of their risk of developing cancer.

Moreover, research on tissue creates psychological and financial risk for people. For example, people have lost their health insurance based on their participation in genetic research.[6] This is another reason people must be allowed to choose which research they will participate in and must be allowed to effectively withdraw from research.

Only by upholding these principles will research continue successfully in the future. People are already hesitant to participate in research. If allowed to stand, the court's judgment below will inhibit future medical research because patients will not agree to participate in studies when they learn that promises made to them in informed consent documents can be disregarded. They also will not participate in research if they have no control over who has their tissue, how that tissue is used, and what types of research are performed on their tissue. Taking this one step further, it is even possible that people will not seek out medical care if they cannot trust that their tissue will not be taken and used in medical research against their will. This is especially a concern for minority individuals, who have been shown to be less likely to seek medical care for existing conditions due to apprehension about what an institution will do with their tissue.

---

[6] National Human Genome Research Institute. "Genetic Discrimination Fact sheet" <http://www.genome.gov/10002328>.

Rayna Rapp, *Refusing Prenatal Diagnosis: The Uneven Meaning of Bioscience in a Multicultural World*, 23 Sci., Tech., and Human Values 45 (1998).

Word of this case is already spreading. Even before this Court has made a determination on the Petitions before it, attorneys for Washington University's ***amici*** are publicly stating that institutions that conduct tissue research "are well advised to review informed consent forms and communications to research participants for consistency with state gift law and other applicable law."[7] According to a 2003 report issued by the Rand Corporation, large research universities including ***amici*** supporting Washington University below allow tissue sources to withdraw samples from research if the samples have not already been unlinked from the participant's identity.[8] Research using biorepositories continued quite adequately and effectively under this system. Now, these universities claim that they can keep the tissue of a person who has withdrawn consent and continue to use it for research. The harmful precedent is already evident. Research institutions that formerly adhered to the federal regulations and allowed participants to withdraw consent by withdrawing tissues have now determined they no longer have to follow this rule. Institutions that previously abided by the federal regulations are now arguing that they

---

[7] Hogan & Hartson LLP, "Eight Circuit Clarifies Ownership of Research Specimens in *Washington University v Catalona*, Health Update, July 12, 2007, pp. 1-3 (www.hhlaw.com).

[8] RAND Corporation Report, "Case Studies of Existing Human Tissue Repositories Practices for Biospecimen Resource for Genomic and Proteomic Era," at 144.

no longer have to follow these regulations. Clearly their concern is not about protecting the participants and honoring their intentions, but rather about securing legal ownership of these samples for the institutions, and the resulting financial benefit.

Us TOO International believes that this lamentable situation underscores why so many millions of people have legitimate concerns about the adequacy of their protection by federal and state laws and current organizational practices. Again, this case is a test of whether promises made by research institutions should be kept. The credibility of this nation's research establishment and commitment to the protection of human research subjects is at stake.

Patients, research participants and their families, such as those ***Us TOO International*** represents, have been turned into treasure troves and potential adversaries by research institutions. Already the news has gone forth to the research institutions that the federal regulatory ban on "exculpatory clauses" prohibiting research institutions from asking patients to waive any of their rights in informed consent forms ***was not even considered*** by the 8th Circuit in its decision.[9] 45 C.F.R. § 46.116. The 8th Circuit erred by not enforcing this provision which prohibits exculpatory language. The federal agency charged with

---

[9] Hogan & Hartson LLP, "Eight Circuit Clarifies Ownership of Research Specimens in *Washington University v Catalona*, Health Update, July 12, 2007, pp. 1-3 (www.hhlaw.com).

protect the rights of people who participate in research, the Office for Human Research Protections, has interpreted this provision to include language asking a participant to give up property rights in his tissue, including:

> "I voluntarily and freely donate any and all blood, urine, and tissue samples . . . and hereby relinquish all right, title, and interest to said items" and "By consent to participate in this research, I give up any property rights I may have in bodily fluids or tissue samples obtained in the course of the research."

http://www.hhs.gov/ohrp/humansubjects/guidance/exculp.htm.

If this Court does not take this matter up for further review, the 8th Circuit's affirmation of the Judgment will be used throughout the nation as a blueprint for the research institutions to shepherd unsuspecting research participants into the fold. Only too late will participants learn that they have lost control of how their bodily tissues can be used in research and that their unique tissues and DNA have become the property of the research institution immediately upon transfer - lock, stock and barrel - and could therefore be sold by the institution or used for any research the institution deems appropriate, regardless of the patient's express wishes.

The district court held that the only rights the patients kept was the right to not provide any more

samples in the future – which is to say, no rights at all. The 8th Circuit held that the patients did have the right to withdraw from research, but complete withdrawal from research without being able to transfer their samples would subvert the purpose of their wish to participate in prostate cancer research in the first place - research that might benefit them, their families, and other patients affected with their disease or similar diseases. Their only option besides letting the university perform whatever research it wants on their tissue – or selling it to a biotech company - according to the 8th Circuit is the choice of demanding the destruction of their tissue, precluding further research by Dr. Catalona – a sobering thought given that 6,000 people have already asked the university to transfer their tissue.

Research in this country is a big business.[10] Washington University has repeatedly emphasized the financial value of the patients' tissue in this case which it claims to be worth over $1 million. The research participants have no such financial interest in the case. They want research to go forward on their tissue for the benefits of themselves, their families, and future generations, as they were promised.

Us TOO International fervently believes this case is not merely a narrow case of state property law, affecting only men from Missouri who requested

---

[10] Washington University claimed net assets of over 5.7 billion dollars in its 2005 Form 990 (the latest form publicly available).

that their samples be transferred to Dr. Catalona. Rather, it is an issue of federal law as well as enormous national importance that affects the entire U.S. public, including the thousands of constituents of ***Us TOO International***. While only men are afflicted with prostate cancer, women are also affected by the disease, as it affects their life partners, their husbands, their fathers, brothers, and sons. All of the petitioners in this case are from states other than Missouri, yet the lower courts' Judgment applies to them just as it does to men in Missouri.

This case has been in the national spotlight, as the Petitioners have pointed out in their petitions and as noted below,[11] because the public has an intense interest in their own property rights and privacy, in the use of their bodily tissues in research, and in their rights and government-regulated

---

[11] *See, e.g.*, Jocelyn Kaiser, Issues with Tissues, 316 *Science* 1829 (June 29, 2007); Jocelyn Kaiser, Biomedical Research: Court Decides Tissue Samples Belong to University, Not Patients, 312 *Science* 346 (April 21, 2006); Hakimian, R. & Korn, D., Ownership and Use of Tissue Specimens in Research, 293 *Journal of the American Medical Association* 1325-26 (March 16, 2005); Charo, R.A., Body of Research: Ownership and Use of Human Tissue, 355 *New England Journal of Medicine* 1517 (October 12, 2006); Goldman, Michael A., Calamity Gene, 445 *Nature* 819-820 (2007); Andrews, Lori, Who Owns Your Body? A Patient's Perspective on *Washington University v. Catalona*, 34 *Journal of Law, Medicine & Ethics* 398-407 (2006); Cheryl W. Henaver, Court: University Owns Research Samples, *USA Today*, June 22, 2007; Crichton, Michael, Opinion, Body Snatchers, 2006, *Wall Street Journal*, December 15, 2006; Rebecca Skloot, Taking the Least of You, *New York Times Magazine*, April 16, 2006.

protections in their research partnerships with institutions.

All research institutions have an avid, vested interest in the outcome of this case, as they can rely on the 8th Circuit court's Judgment to lay ownership claims to samples collected by unwitting participants at their own institutions. However, federal regulations and the Common Rule require that samples provided by research participants may be used only in institutional board-approved research protocols that have been fully explained to the participants, and then only after informed consent has been ***voluntarily*** given. Both the research protocols and informed consent documents are governed by federal regulations, and all research institutions that receive federal funds, such as Washington University, must comply with them. 46 C.F.R. § 46.116.

These governing federal regulations are in direct conflict with the 8th Circuit's judgment. If the patients and research participants cannot turn to the federal courts to enforce federal regulations promulgated for their protection in human research studies, to whom can they turn?

Another important aspect of the samples being linked to an individual person and thus being personally identifiable[12] is particularly important to ***Us TOO International***. We believe that, especially in the emerging era of personalized medicine, it is vital that patients retain some control of how their tissues

are used in research.[13] Medications are being developed which are only recommended for people with a specific genetic makeup or whose cancerous tumors had a specific genome. Anonymizing the research participants' tissue or forcing them to order it to be destroyed ruins this opportunity.

Our support extends not only to the victims of prostate cancer but also their families who might someday benefit from the knowledge of the particular genetic mutation which caused a relative's cancer. People provided their tissue for Dr. Catalona's research because they were told it would benefit their families. It is imperative that genetic research on tissue samples be used to alert "members of [a patient's] family who are at high risk of developing prostate cancer." In the consent forms signed by the patients and research participants in this case, one of the "potential benefits" listed was the ability to notify, where appropriate, patients' families of such risks. This benefit could only be realized by keeping the tissue samples traceable to their source.[14]

As a policy, the position of this friend of the court is: legally and ethically, the patient - not the university or researcher - must have the ultimate say concerning the use of his bodily tissues in research. ***Us TOO International*** believes that having the Courts protect patients' rights in their relationship with the biomedical research establishment, under federal regulations and the

Common Rule, is crucial to ensure their willingness to participate in research.

Us TOO International is strongly committed to the proposition that, concerning choices about disease prevention, early detection, treatment, or participation in research, the patient's interests should come before the interests of any institution or practitioner. While the institution or practitioner has the responsibility to fully inform the patient about the potential risks, benefits and other implications of such choices, based on the full spectrum of evidence, any decisions about participation and its scope must remain with the patient.

In clear conflict with the federal regulations and patients' rights, the federal district court's rejection of this fundamental principle of human subjects research is of compelling national importance to merit its review by the Supreme Court.

When research participants volunteer and sign agreements as to their understanding of what will be done with their bodily tissues, their wishes as reflected in these agreements should be respected and honored by the institutions and researchers collecting specimens and by the courts. As the 8th Circuit failed to apply federal law appropriate to this case, the Supreme Court should review this matter.

CONCLUSION

WHEREFORE, for all the foregoing reasons, ***Us TOO International*** respectfully requests that this court grant the petitions of the petitioners for a writ of certiorari.

Respectfully submitted,

Robert S. Adler
